1 Introduction

With the introduction of Jonathan Kew's XeTeX,¹ users can now easily access system-wide fonts directly in a TeX variant, providing a best of both worlds environment. XeTeX eliminates the need for all those files required for installing fonts (.tfm, .vf, .map, ...) and provides an easy way to select fonts in Plain TeX: `\font\tenrm="Times New Roman" at 10pt`.

Before `fontspec`, it was still necessary to write cumbersome font definition files for L^ATeX, since the NFSS had a lot more going on behind the scenes to allow easy commands like `\emph` or `\bfseries`.

This package provides a completely automatic way to select font families in L^ATeX for arbitrary fonts. Furthermore, it allows very flexible control over the selection of advanced font features such as number case and fancy ligatures (and many more!) present in most modern fonts.

1.1 Usage

For basic use, no package options are required:

```
\usepackage{fontspec}% provides font selecting commands
\usepackage{xunicode}% provides unicode character macros
\usepackage{xltextra} % provides some fixes/extras
```

Ross Moore's `xunicode` package is highly recommended, as it provides access L^ATeX's various methods for accessing extra characters and accents (for example, `\%`, `\$`, `\textbullet`, `\"u`, and so on), plus many more unicode characters.

The `xltextra` package adds a couple of general improvements to L^ATeX under XeTeX; it also provides the `\XeTeX` macro to typeset the XeTeX logo.

The babel package is not really supported! Especially Vietnamese, Greek, and Hebrew at least might not work correctly, as far as I can tell. There's a better chance with Cyrillic and Latin-based languages, however—`fontspec` ensures at least that fonts should load correctly, but hyphenation and other matters aren't guaranteed.

1.1.1 Latin Modern defaults

`fontspec` defines a new L^ATeX font encoding for its purposes to allow the Latin Modern fonts to be used by default ←. This has three implications:

1. Unicode fonts are loaded by default; it didn't make sense to have the legacy Computer Modern fonts in the Unicode-enabled XeTeX.
2. If you don't have the Latin Modern OpenType fonts installed, you might want to consider doing so.

¹<http://scripts.sil.org/xetex>

3. `fontspec` also requires the `euenc` package² to be installed.

Another package option is provided for controlling this behaviour: `[cm-default]` will ignore the Latin Modern fonts and go about things as it used to. Use this option if you don't have the Latin Modern fonts installed or you (Mac-specifically) want to use the 'default TeX font' without using the `xdvipdfmx` driver.

1.1.2 Configuration

If you wish to customise any part of the `fontspec` interface (see later in this manual, Section 7 on page 27 and Section 7.1), this should be done by creating your own `fontspec.cfg` file,³ which will be automatically loaded if it is found by XeTeX. Either place it in the same folder as the main document for isolated cases, or in a location that XeTeX searches by default, *e.g.*, `~/Library/texmf/xelatex/`. The package option `[noconfig]` will suppress this behaviour under all circumstances.

1.1.3 Warnings

This package can give many warnings that can be harmless if you know what you're doing. Use the `[quiet]` package option to write these warnings to the transcript (`.log`) file instead.

1.2 Warning

I still consider this package to be experimental, so I'm not ensuring backwards compatibility at all costs. I don't want to weigh the package down with old ways of doing things, so unfortunately this will mean that some old documents will need to be modified in order to compile correctly after future updates. It'll be worth it in the long run, but you can curse at my lack of foresight as much as you wish in the meantime.

→ v1.6: An example warning!

Such things, and some other comments, are noted in the margin like this ←, with a red arrow if the change is relevant to the current release of the package. (New features are denoted similarly in blue.)

1.3 About this manual

This document has been typeset with XeTeX using a variety of fonts to display various features that the package supports. You will not be able to typeset the documentation if you do not have all of these fonts, many of which are distributed with Mac OS X or are otherwise commercial.

²<http://tug.ctan.org/cgi-bin/ctanPackageInformation.py?id=euenc>

³An example is distributed with the package.

Many examples are shown in this manual. These are typeset side-by-side with their verbatim source code, although various size-altering commands (`\large`, `\Huge`, *etc.*) are omitted for clarity. Since the package supports font features for both AAT and OpenType fonts (whose feature sets only overlap to some extent), examples are distinguished by colour: blue and red, respectively. Examples whose font type is irrelevant are typeset in green.

2 Brief overview

This manual can get rather in-depth, as there are a lot of font features to cover. A basic preamble set-up is shown below, to simply select some default document fonts. See the file `fontspec-example.tex` for a more detailed example.

```
\usepackage{fontspec}
\defaultfontfeatures{Scale=MatchLowercase}
\setromanfont[Mapping=tex-text]{Baskerville}
\setsansfont[Mapping=tex-text]{Skia}
\setmonofont{Courier}
```

3 Font selection

`\fontspec` `\fontspec[]{}` is the base command of the package, used for selecting the specified ** in a L^AT_EX family. The font features argument accepts comma separated *=<option>* lists; these will not be fully described until Section 6 on page 14.

As our first example, look how easy it is to select the Hoefler Text typeface with the `fontspec` package:

<pre>The five boxing wizards jump quickly. <i>The five boxing wizards jump quickly.</i> THE FIVE BOXING WIZARDS JUMP QUICKLY. <i>THE FIVE BOXING WIZARDS JUMP QUICKLY.</i> The five boxing wizards jump quickly. <i>The five boxing wizards jump quickly.</i> <i>THE FIVE BOXING WIZARDS JUMP QUICKLY.</i> <i>THE FIVE BOXING WIZARDS JUMP QUICKLY.</i></pre>	<pre>\def\pangram{The five boxing wizards jump quickly.\\} \fontspec{Hoefler Text} \pangram {\itshape \pangram} {\scshape \pangram} {\scshape\itshape \pangram} \bfseries \pangram {\itshape \pangram} {\scshape \pangram} {\itshape\scshape \pangram}</pre>
---	--

The `fontspec` package takes care of the necessary font definitions for those shapes as shown above *automatically*. Furthermore, it is not necessary to install the font for X_YL^AT_EX in any way whatsoever: every font that is installed in the operating system may be accessed.

3.1 Default font families

`\setmainfont` The `\setmainfont`,⁴ `\setsansfont`, and `\setmonofont` commands are used to select the default font families for the entire document. They take the same arguments as `\fontspec`. For example:

```
\setmainfont{Baskerville}
\setsansfont[Scale=0.86]{Skia}
\setmonofont[Scale=0.8]{Monaco}
\rmfamily\pangram\par
\sffamily\pangram\par
\ttfamily\pangram
```

Pack my box with five dozen liquor jugs.
Pack my box with five dozen liquor jugs.
Pack my box with five dozen liquor jugs.

Here, the scales of the fonts have been chosen to equalise their lowercase letter heights. The `Scale` font feature will be discussed further in Section 5 on page 11, including methods for automatic scaling.

3.2 Font instances for efficiency

`\newfontfamily` For cases when a specific font with a specific feature set is going to be re-used many times in a document, it is inefficient to keep calling `\fontspec` for every use. While the command does not define a new font instance after the first call, the feature options must still be parsed and processed.

For this reason, *instances* of a font may be created with the `\newfontfamily` command, ← as shown in the following example:

→ v1.11: This macro used to be called `\newfontinstance`. Backwards compatibility is preserved via `fontspec.cfg`.

```
\newfontfamily\notefont{Didot}
\notefont This is a \emph{note}.
```

This is a *note*.

This macro should be used to create commands that would be used in the same way as `\rmfamily`, for example.

`\newfontface` Sometimes only a specific font face is desired, without accompanying italic or bold variants. This is common when selecting a fancy italic font, say, that has swash features unavailable in the upright forms. `\newfontface` is used for this purpose: ←

→ v1.11: New!

```
\newfontface\fancy
[Contextuals={WordInitial,WordFinal}]
{Hoefler Text Italic}
\fancy where is all the vegemite
```

where is all the vegemite

This example is repeated in Section 6.6 on page 18.

⁴Or `\setromanfont`, a historical name that doesn't make much sense when you're, say, typesetting Greek.

3.3 Arbitrary bold/italic/small caps fonts

The automatic bold, italic, and bold italic font selections will not be adequate for the needs of every font: while some fonts mayn't even have bold or italic shapes, in which case a skilled (or lucky) designer may be able to chose well-matching accompanying shapes from a different font altogether, others can have a range of bold and italic fonts to chose between. The `BoldFont` and `ItalicFont` features ← are provided for these situations. If only one of these is used, the bold italic font is requested as the default from the *new* font.

→ v1.6: These features used to be called `Bold` and `Italic`, and these shorter names may still be used if you desire.

<p>Helvetica Neue UltraLight <i>Helvetica Neue UltraLight Italic</i> Helvetica Neue <i>Helvetica Neue Italic</i></p>	<pre>\fontspec[BoldFont={Helvetica Neue}] {Helvetica Neue UltraLight} Helvetica Neue UltraLight \\\ {\itshape Helvetica Neue UltraLight Italic} \\\ {\bfseries Helvetica Neue } \\\ {\bfseries\itshape Helvetica Neue Italic} \\\</pre>
--	--

If a bold italic shape is not defined, or you want to specify *both* custom bold and italic shapes, the `BoldItalicFont` feature is provided ←.

For those cases that the base font name is repeated, you can replace it with an asterisk (first character only). For example, some space can be saved instead of writing 'Baskerville SemiBold':

<p>Baskerville <i>Italic</i> SemiBold <i>Italic</i></p>	<pre>\fontspec[BoldFont={* SemiBold}]{Baskerville} Baskerville \textit{Italic} \bfseries SemiBold \textit{Italic}</pre>
--	---

Old-fashioned font families used to distribute their small caps glyphs in separate fonts due to the limitations on the number of glyphs allowed in the PostScript Type 1 format. Such fonts may be used by declaring the `SmallCapsFont` of the family you are specifying:

<p>Roman 123 <small>SMALL CAPS 456</small></p>	<pre>\fontspec[SmallCapsFont={Minion MM Small Caps & Oldstyle Figures},]{Minion MM Roman} Roman 123 \\\ \textsc{Small caps 456}</pre>
---	---

3.4 Math(s) fonts

When `\setmainfont`, `\setsansfont` and `\setmonofont` are used in the preamble, they also define the fonts to be used in maths mode inside the `\mathrm`-type commands. This only occurs in the preamble because L^AT_EX freezes the maths fonts after this stage of the processing. The `fontspec` package must also be loaded after any maths font packages (*e.g.*, `euler`) to be successful. (Actually, it is *only* `euler` that is the problem.)

<pre>\setmathrm \setboldmathrm \setmathsf \setmathtt</pre>	<p>However, the default text fonts may not necessarily be the ones you wish to use when typesetting maths (especially with the use of fancy ligatures and so</p>
--	--

on). For this reason, you may optionally use those commands listed in the margin (in the same way as our other `\fontspec`-like commands) to explicitly state which fonts to use inside such commands as `\mathrm`. Additionally, the `\setboldmathrm` command allows you define the font used for `\mathrm` when in bold maths mode (which is activated with, among others, `\boldmath`).

For example, if you were using Optima with the Euler maths font, you might have this in your preamble:

```
\usepackage[mathcal]{euler}
\usepackage{fontspec,xunicode}
\setmainfont{Optima Regular}
\setmathrm{Optima}
\setboldmathrm[BoldFont=Optima ExtraBlack]{Optima Bold}
```

and this would allow you to typeset something like this:

$X \rightarrow X \rightarrow \mathbf{X}$	<code>\$ X \rightarrow \mathrm{X} \rightarrow \mathbf{X} \$</code>
$\mathbf{X} \rightarrow \mathbf{X} \rightarrow \mathbf{X}$	<code>\\boldmath</code>
	<code>\$ X \rightarrow \mathrm{X} \rightarrow \mathbf{X} \$</code>

3.5 External fonts

X_YTeX v0.995 introduced the feature of loading fonts not installed through the operating system (‘external’ fonts). This feature is currently only available through the `xdvipdfmx` driver, which is notably *not* the default on Mac OS X.

This feature is handled in `fontspec` with the font feature `ExternalLocation`. When this feature is used, the main argument to `\fontspec` is the *file name* of the font (in contrast to the usual syntax which requires the font display name) and the argument to the feature is the (absolute) path to the font. For example:

```
\fontspec[ExternalLocation=/Users/will/Fonts/]{CODE2000.TTF}
```

If no path is given, then the font will be found in a location normally searched by X_YTeX, including the current directory. For example, the following declaration could load either the Latin Modern roman font in the current directory or, say, in `$TEXMF/fonts/opentype/public/lm/`:

```
\fontspec[ExternalLocation]{lmroman10-regular}
```

Bold and italic fonts cannot be automatically selected when external fonts are being used; they must be explicitly declared using the methods described in Section 3.3 on the preceding page.

3.6 Miscellaneous font selecting details

By the way, from v1.9, `\fontspec` and `\addfontfeatures` will now ignore following spaces as if it were a ‘naked’ control sequence; e.g., ‘M. `\fontspec{...}` N’ and ‘M. `\fontspec{...}`N’ are the same.

Note that this package redefines the `\itshape` and `\scshape` commands in order to allow them to select italic small caps in conjunction. (This was implicitly shown in the first example, but it’s worth mentioning now, too.)

4 Selecting font features

The commands discussed so far each take an optional argument for accessing the font features of the requested font. These features are generally unavailable or harder to access in regular L^AT_EX. The font features and their options are described in Section 6 on page 14, but before we look at the range of available font features, it is necessary to discuss how they can be applied.

4.1 Default settings

`\defaultfontfeatures` It is desirable to define options that are applied to every subsequent font selection command: a default feature set, so to speak. This may be defined with the `\defaultfontfeatures{font features}` command. New calls of `\defaultfontfeatures` overwrite previous ones.

```
Some ‘default’ Didot 0123456789          \fontspec{Didot}
Now grey, with old-style figures: 0123456789  Some ‘default’ Didot 0123456789          \
\defaultfontfeatures{Numbers=OldStyle, Colour=888888}
\fontspec{Didot}
Now grey, with old-style figures: 0123456789
```

4.2 Changing the currently selected features

`\addfontfeatures` The `\addfontfeatures{font features}` command allows font features to be changed without knowing what features are currently selected or even what font is being used. A good example of this could be to add a hook to all tabular material to use monospaced numbers, as shown in the following example:

'In 1842, 999 people sailed 97 miles in 13 boats. In 1923, 111 people sailed 54 miles in 56 boats.'

Year	People	Miles	Boats
1842	999	75	13
1923	111	54	56

```
\fontspec[Numbers=OldStyle]{Skia}
`In 1842, 999 people sailed 97 miles in
13 boats. In 1923, 111 people sailed 54
miles in 56 boats.' \bigskip

{\addfontfeatures{Numbers={Monospaced,Lining}}
\begin{tabular}{@{} cccc @{}}
\toprule Year & People & Miles & Boats \\\
\midrule 1842 & 999 & 75 & 13 \\\
          1923 & 111 & 54 & 56 \\\
\bottomrule
\end{tabular}}
```

`\addfontfeature` This command may also be executed under the alias `\addfontfeature`.

4.3 Priority of feature selection

Features defined with `\addfontfeatures` override features specified by `\fontspec`, which in turn override features specified by `\defaultfontfeatures`. If in doubt, whenever a new font is chosen for the first time, an entry is made in the transcript (`.log`) file displaying the font name and the features requested.

4.4 Different features for different font shapes

It is entirely possible that separate fonts in a family will require separate options; *e.g.*, Hoefler Text Italic contains various swash feature options that are completely unavailable in the upright shapes.

The font features defined at the top level of the optional `\fontspec` argument are applied to *all* shapes of the family. Using `Upright-`, `SmallCaps-`, `Bold-`, `Italic-`, and `BoldItalicFeatures`, separate font features may be defined to their respective shapes *in addition* to, and with precedence over, the 'global' font features.

ATTENTION ALL MARTINI DRINKERS
ATTENTION ALL MARTINI DRINKERS

```
\fontspec{Hoefler Text} \itshape \scshape
Attention All Martini Drinkers \\\
\addfontfeature{ItalicFeatures={Alternate = 1}}
Attention All Martini Drinkers \\\
```

Combined with the options for selecting arbitrary *fonts* for the different shapes, these separate feature options allow the selection of arbitrary weights in the Skia typeface, for example:

Skia
Skia 'Bold'

```
\fontspec[BoldFont={Skia},
BoldFeatures={Weight=2}]{Skia}
Skia \\\ \bfseries Skia `Bold'
```

Note that because most fonts include their small caps glyphs within the main font, these features are applied *in addition* to any other shape-specific features as

defined above, and hence `SmallCapsFeatures` can be nested within `ItalicFeatures` and friends. Every combination of upright, italic, bold and small caps can thus be assigned individual features, as shown in the following ludicrous example.

	<code>\fontspec[</code>
	<code>UprightFeatures={Colour = 220022,</code>
	<code>SmallCapsFeatures = {Colour=115511}},</code>
	<code>ItalicFeatures={Colour = 2244FF,</code>
	<code>SmallCapsFeatures = {Colour=112299}},</code>
Upright SMALL CAPS	<code>BoldFeatures={Colour = FF4422,</code>
<i>Italic</i> ITALIC SMALL CAPS	<code>SmallCapsFeatures = {Colour=992211}},</code>
Bold BOLD SMALL CAPS	<code>BoldItalicFeatures={Colour = 888844,</code>
Bold Italic BOLD ITALIC SMALL	<code>SmallCapsFeatures = {Colour=444422}},</code>
CAPS	<code>] {Hoefler Text}</code>
	<code>Upright {\scshape Small Caps}\</code>
	<code>\itshape Italic {\scshape Italic Small Caps}\</code>
	<code>\upshape\bfseries Bold {\scshape Bold Small Caps}\</code>
	<code>\itshape Bold Italic {\scshape Bold Italic Small Caps}</code>

4.5 Different features for different font sizes

→ v1.13: New!

The `SizeFeature` feature ← is a little more complicated than the previous features discussed. It allows different fonts and different font features to be selected for a given font family as the point size varies.

It takes a comma separated list of braced, comma separated lists of features for each size range. Each sub-list must contain the `Size` option to declare the size range, and optionally `Font` to change the font based on size. Other (regular) `fontspec` features that are added are used on top of the font features that would be used anyway.

<i>Small</i>	<code>\fontspec[SizeFeatures={</code>
Normal size	<code>{Size={-8}, Font=Apple Chancery, Colour=AA0000},</code>
Large	<code>{Size={8-14}, Colour=00AA00},</code>
	<code>{Size={14-}, Colour=0000AA}] {Skia}</code>
	<code>{\scriptsize Small\par} Normal size\par {\Large Large\par}</code>

A less trivial example is shown in the context of optical font sizes in Section 6.2 on page 15.

To be precise, the `Size` sub-feature accepts arguments in the form shown in Table 1 on the next page. Braces around the size range are optional. For an exact font size (`Size=X`) font sizes chosen near that size will ‘snap’. For example, for size definitions at exactly 11pt and 14pt, if a 12pt font is requested *actually* the 11pt font will be selected. This is a remnant of the past when fonts were designed in metal (at obviously rigid sizes) and later when bitmap fonts were similarly designed for fixed sizes.

Input	Font size, s
Size = X-	$s \geq X$
Size = -Y	$s < Y$
Size = X-Y	$X \leq s < Y$
Size = X	$s = X$

Table 1: Syntax for specifying the size to apply custom font features.

If additional features are only required for a single size, the other sizes must still be specified. As in:

```
SizeFeatures={
  {Size=-10,Numbers=Uppercase},
  {Size=10-}}
```

Otherwise, the font sizes greater than 10 won't be defined!

5 Font independent options

Features introduced in this section may be used with any font.

5.1 Scale

In its explicit form, `Scale` takes a single numeric argument for linearly scaling the font, as demonstrated in Section 3.1 on page 5. Since version 0.99 of \XeTeX , however, it is now possible to measure the correct dimensions of the fonts loaded, and hence calculate values to scale them automatically.

→ v1.9: As of Dec. 2005

The `Scale` feature now also takes the options `MatchLowercase` and `MatchUppercase`, which will scale the font being selected to match the current default roman font to either the height of the lowercase or uppercase letters, respectively.

The perfect match is hard to find.
LOGO FONT

```
\setmainfont{Georgia}
\newfontfamily\lc[Scale=MatchLowercase]{Verdana}
The perfect match {\lc is hard to find.}\
\newfontfamily\uc[Scale=MatchUppercase]{Arial}
L O G O \uc F O N T
```

The amount of scaling used in each instance is reported in the `.log` file. Since there is some subjectivity about the exact scaling to be used, these values should be used to fine-tune the results.

5.2 Mapping

Mapping enables a \XeTeX text-mapping scheme.

“¡A small amount of—text!”

```
\fontspec[Mapping=tex-text]{Cochin}
`!`A small amount of---text!''
```

5.3 Colour

Colour (or Color), also shown in Section 4.1 on page 8 and Section 6 on page 14, uses X_YTeX font specifications to set the colour of the text. The colour is defined as a triplet of two-digit Hex RGB values, with optionally another value for the transparency (where 00 is completely transparent and FF is opaque.)

```
\fontsize{48}{48}
\fontspec{Hoefler Text Black}
{\addfontfeature{Color=FF000099}W}\kern-1ex
{\addfontfeature{Color=0000FF99}S}\kern-0.8ex
{\addfontfeature{Color=DDBB2299}P}\kern-0.8ex
{\addfontfeature{Color=00BB3399}R}
```

5.4 Interword space

While the space between words can be varied on an individual basis with the T_EX primitive `\spaceskip` command, it is more convenient to specify this information when the font is first defined.

The space in between words in a paragraph will be chosen automatically by X_YTeX, and generally will not need to be adjusted. For those times when the precise details are important, the `WordSpace` features is provided, which takes either a single scaling factor to scale the value that X_YTeX has already chosen, or a triplet of comma-separated values for the nominal value, the stretch, and the shrink of the interword space, respectively. *I.e.*, `WordSpace=0.8` is the same as `WordSpace={0.8,0.8,0.8}`.

For example, I believe that the Cochin font, as distributed with Mac OS X, is too widely spaced. Now, this can be rectified, as shown below.

Some filler text for our example to take up some space, and to demonstrate the large default interword space in *Cochin*.

```
\fontspec{Cochin}
\fillertext
\vspace{1em}
```

Some filler text for our example to take up some space, and to demonstrate the large default interword space in *Cochin*.

```
\fontspec[ WordSpace = {0.7 , 0.8 , 0.9} ]{Cochin}
\fillertext
```

Be careful with the unpredictable things that the AAT font renderer can do with the text! Unlike T_EX, Mac OS X will allow fonts to letterspace themselves, which can be seen above; OpenType fonts, however, will not show this tendency, as they do not support this arguably dubious feature.

5.5 Post-punctuation space

If `\frenchspacing` is *not* in effect, T_EX will allow extra space after some punctuation in its goal of justifying the lines of text. Generally, this is considered old-fashioned, but occasionally in small amounts the effect can be justified, pardon the pun.

The `PunctuationSpace` feature takes a scaling factor by which to adjust the nominal value chosen for the font. Note that `PunctuationSpace=0` is *not* equivalent to `\frenchspacing`, although the difference will only be apparent when a line of text is under-full.

	<code>\nonfrenchspacing</code>
	<code>\fontspec{Baskerville}</code>
Letters, Words. Sentences.	Letters, Words. Sentences. <code>\par</code>
Letters, Words. Sentences.	<code>\fontspec[PunctuationSpace=0.5]{Baskerville}</code>
Letters, Words. Sentences.	Letters, Words. Sentences. <code>\par</code>
	<code>\fontspec[PunctuationSpace=0]{Baskerville}</code>
	Letters, Words. Sentences.

Also be aware that the above caveat for interword space also applies here, so after the last line in the above example, the `PunctuationSpace` for *all* Baskerville instances will be 0.

5.6 Letter spacing

Letter spacing, or tracking, is the term given to adding (or subtracting) a small amount of horizontal space in between adjacent characters. It is specified with the `LetterSpace`, which takes a numeric argument.

The letter spacing parameter is a normalised additive factor (not a scaling factor); it is defined as a percentage of the font size. That is, for a 10 pt font, a letter spacing parameter of '1.0' will add 0.1 pt between each letter.

	<code>\fontspec{Didot}</code>
	<code>\addfontfeature{LetterSpace=0.0}</code>
USE TRACKING FOR DISPLAY CAPS TEXT	USE TRACKING FOR DISPLAY CAPS TEXT <code>\</code>
USE TRACKING FOR DISPLAY CAPS TEXT	<code>\addfontfeature{LetterSpace=2.0}</code>
	USE TRACKING FOR DISPLAY CAPS TEXT

This functionality *should not be used for lowercase text*, which is spacing correctly to begin with, but it can be very useful, in small amounts, when setting small caps or all caps titles. Also see the OpenType `Uppercase` option of the `Letters` feature (Section 6.4 on page 17).

5.7 The hyphenation character

The letter used for hyphenation may be chosen with the `HyphenChar` feature. It takes three types of input, which are chosen according to some simple rules. If

the input is the string `None`, then hyphenation is suppressed for this font. If the input is a single character, then this character is used. Finally, if the input is longer than a single character it must be the UTF-8 slot number of the hyphen character you desire.

Below, Adobe Garamond Pro’s uppercase hyphenation character⁵ is used to demonstrate a possible use for this feature. The second example redundantly demonstrates the default behaviour of using the hyphen as the hyphenation character.

<p>A MULTITUDE OF OBSTREPEROUSLY HYPHENATED ENTITIES</p> <p>A MULTITUDE OF OBSTREPER- OUSLY HYPHENATED ENTITIES</p> <p>A MULTITUDE OF OBSTREPER- OUSLY HYPHENATED ENTITIES</p>	<pre>\def\text {A MULTITUDE OF OBSTREPEROUSLY HYPHENATED ENTITIES \par\vspace{1ex}} \fontspec[HyphenChar=None]{Adobe Garamond Pro} \text \fontspec[HyphenChar=-]{Adobe Garamond Pro} \text \fontspec[HyphenChar="F6BA]{Adobe Garamond Pro} \text</pre>
--	--

Note that in an actual situation, the `Uppercase` option of the `Letters` feature would probably supply this for you (see Section 6.4 on page 17).

The `xltextra` package redefines L^AT_EX’s `\-` macro such that it adjusts along with the above changes.

6 Font-dependent features

This section covers each and every font feature catered for by this package. Some, in fact, have already be seen in previous sections. There are too many to list in this introduction, but for a first taste of what is available, here is an example of the Apple Chancery typeface:

*My 1st example of
Apple Chancery*

```
\fontspec[
  Colour=CC00CC,
  Numbers=OldStyle,
  VerticalPosition=Ordinal,
  Variant=2]{Apple Chancery}
My 1st example of\ Apple Chancery
```

Multiple options may be given to any feature that accepts non-numerical input, although doing so will not always work. Some options will override others in generally obvious ways; `Numbers={OldStyle,Lining}` doesn’t make much sense because the two options are mutually exclusive, and X₃L^AT_EX will simply use the last option that is specified (in this case using `Lining` over `OldStyle`).

If a feature or an option is requested that the font does not have, a warning is given in the console output. As mentioned in 1.1.3 on page 3 these warnings can be suppressed by selecting the `[quiet]` package option.

⁵I found the character, and its number, in Mac OS X’s Character Palette.

6.1 Different font technologies: AAT and ICU

X_YTeX supports two rendering technologies for typesetting, selected with the `Renderer` font feature. The first, AAT, is that provided (only) by Mac OS X itself. The second, ICU, is an open source OpenType interpreter. It provides much greater support for OpenType features, notably contextual arrangement, over AAT.

In general, this feature will not need to be explicitly called: for OpenType fonts, the ICU renderer is used automatically, and for AAT fonts, AAT is chosen by default. Some fonts, however, will contain font tables for *both* rendering technologies, such as the Hiragino Japanese fonts distributed with Mac OS X, and in these cases the choice may be required.

Among some other font features only available through a specific renderer, ICU provides for the `Script` and `Language` features, which allow different font behaviour for different alphabets and languages; see Section 6.19 on page 25 for the description of these features. *Because these font features can change which features are able to be selected for the font instance, they are selected by `fontspec` before all others and will automatically and without warning select the ICU renderer.*

6.2 Optical font sizes

Optically scaled fonts thicken out as the font size decreases in order to make the glyph shapes more robust (less prone to losing detail), which improves legibility. Conversely, at large optical sizes the serifs and other small details may be more delicately rendered.

Optically sized fonts can be seen in either OpenType or Multiple Master varieties. The differences when dealing with these two are quite significant. OpenType fonts with optical scaling will exist in several discrete sizes, and these will be selected by X_YTeX *automatically* determined by the current font size. The `OpticalSize` option may be used to specify a different optical size.

For the OpenType font Warnock Pro, we have three optically sized variants: `caption`, `subhead`, and `display`. With `OpticalSize` set to zero, no optical size font substitution is performed:

```
Warnock Pro optical sizes \fontspec[OpticalSize=0]{Warnock Pro Caption}
Warnock Pro optical sizes Warnock Pro optical sizes      \\
Warnock Pro optical sizes \fontspec[OpticalSize=0]{Warnock Pro}
Warnock Pro optical sizes Warnock Pro optical sizes      \\
Warnock Pro optical sizes \fontspec[OpticalSize=0]{Warnock Pro Subhead}
Warnock Pro optical sizes Warnock Pro optical sizes      \\
Warnock Pro optical sizes \fontspec[OpticalSize=0]{Warnock Pro Display}
Warnock Pro optical sizes Warnock Pro optical sizes
```

Automatic OpenType optical scaling is shown in the following example, in which we've scaled down some large text in order to be able to compare the difference for equivalent font sizes: (this gives the same output as we saw in the previous example for Warnock Pro Display)

Automatic optical size	<code>\fontspec{Warnock Pro}</code>	
Automatic optical size	Automatic optical size	\\
Automatic optical size	<code>\scalebox{0.4}{\Huge</code>	
	Automatic optical size}	

Multiple Master fonts, on the other hand, are parameterised over orthogonal font axes, allowing continuous selection along such features as weight, width, and optical size (see Section 6.18 on page 25 for further details). Whereas an OpenType font will have only a few separate optical sizes, a Multiple Master font’s optical size can be specified over a continuous range. Unfortunately, this flexibility makes it harder to create an automatic interface through L^AT_EX, and the optical size for a Multiple Master font must always be specified explicitly.

MM optical size test	<code>\fontspec[OpticalSize=11]{Minion MM Roman}</code>	
MM optical size test	MM optical size test	\\
MM optical size test	<code>\fontspec[OpticalSize=47]{Minion MM Roman}</code>	
MM optical size test	MM optical size test	\\
MM optical size test	<code>\fontspec[OpticalSize=71]{Minion MM Roman}</code>	
	MM optical size test	\\

The SizeFeatures feature (Section 4.5 on page 10) can be used to specify exactly which optical sizes will be used for ranges of font size. For example, something like

```
\fontspec[
  SizeFeatures={
    {Size=-10,    OpticalSize=8 },
    {Size= 10-14, OpticalSize=10},
    {Size= 14-18, OpticalSize=14},
    {Size= 18-,  OpticalSize=18}}
]{Warnock Pro}
```

6.3 Ligatures

Ligatures refer to the replacement of two separate characters with a specially drawn glyph for functional or æsthetic reasons. For AAT fonts, you may choose from any combination of Required, Common, Rare (or Discretionary), Logos, Rebus, Diphthong, Squared, AbbrevSquared, and Icelandic.

The first three are also supported in OpenType fonts, which may also use Historical and Contextual. To turn a ligature option *off*, prefix its name with No: *e.g.*, NoDiphthong.

strict firefly	<code>\fontspec[Ligatures=Rare]{Hoefler Text}</code>	
strict firefly	strict firefly	\\
strict firefly	<code>\fontspec[Ligatures=NoCommon]{Hoefler Text}</code>	
	strict firefly	

Rare: Ð Þ ð þ
 Logos: 🍏
 Rebus: %oo
 Diphthong: Æ Œ æ œ

```
\fontspec
  [Ligatures={Rare,Logos,Rebus,Diphthong}]
  {Palatino}
Rare: Dh Th dh th      \\
Logos: apple           \\
Rebus: \%0             \\
Dipht\null hong: AE OE ae oe
```

Some other Apple AAT fonts have those ‘Rare’ ligatures contained in the Icelandic feature. Notice also that the old TeX trick of splitting up a ligature with an empty brace pair does not work in XeTeX; you must use a `o pt kern` or `\hbox` (e.g., `\null`) to split the characters up.

6.4 Letters

→ v1.6: This feature has changed names along with its options, **breaking** backwards compatibility!

The `Letters` feature ← specifies how the letters in the current font will look. For AAT fonts, you may choose from `Normal`, `Uppercase`, `Lowercase`, `SmallCaps`, and `InitialCaps`.

THIS SENTENCE NO VERB
 this sentence no verb
 This Sentence No Verb

```
\fontspec[Letters=Uppercase]{Palatino}
THIS Sentence no verb      \\
\fontspec[Letters=Lowercase]{Palatino}
THIS Sentence no verb     \\
\fontspec[Letters=InitialCaps]{Palatino}
THIS Sentence no verb
```

→ v1.9: The `Uppercase` . . . variants have changed (e.g., from `SMALLCAPS`) to allow for more flexible option handling in the future. The old forms still work, for now...

OpenType fonts have some different options: `Uppercase`, `SmallCaps`, `PetiteCaps`, `UppercaseSmallCaps`, `UppercasePetiteCaps`, and `Unicase`. ← `Petite caps` are smaller than small caps. Mixed case commands turn lowercase letters into the smaller caps letters, whereas uppercase options turn the capital letters to the smaller caps (good, e.g., for applying to already uppercase acronyms like ‘NASA’). ‘Unicase’ is a weird hybrid of upper and lower case letters.

THIS SENTENCE NO VERB
 THIS SENTENCE no verb

```
\fontspec[Letters=SmallCaps]{Warnock Pro}
THIS SENTENCE no verb      \\
\fontspec[Letters=UppercaseSmallCaps]{Warnock Pro}
THIS SENTENCE no verb
```

The `Uppercase` option is also provided *but* it will (probably) not actually map letters to uppercase.⁶ It will, however, select various uppercase forms for glyphs such as accents and dashes.

UPPER-CASE EXAMPLE
 UPPER-CASE EXAMPLE

```
\fontspec{Warnock Pro}
UPPER-CASE EXAMPLE \\
\addfontfeature{Letters=Uppercase}
UPPER-CASE EXAMPLE
```

⁶If you want automatic uppercase letters, look to L^AT_EX’s `\MakeUppercase` command.

The Kerning feature also contains an Uppercase option, which adds a small amount of spacing in between letters (see Section 6.13 on page 22). This feature was originally planned to be included with the one above (so Letters=Uppercase would do both punctuation *and* tracking), but I decided that it would be a bad idea to break the one-to-one correspondence with fontspec and OpenType features. (Sorry TUGboat readers!)

6.5 Numbers

The Numbers feature defines how numbers will look in the selected font. For both AAT and OpenType fonts, they may be a combination of Lining or OldStyle and Proportional or Monospaced (the latter is good for tabular material). The synonyms Uppercase and Lowercase are equivalent to Lining and OldStyle, respectively. The differences have been shown previously in Section 4.2 on page 8.

For OpenType fonts, there is also the SlashedZero option which replaces the default zero with a slashed version to prevent confusion with an uppercase ‘O’.

0123456789 0123456789	\fontspec[Numbers=Lining]{Warnock Pro} 0123456789
	\fontspec[Numbers=SlashedZero]{Warnock Pro} 0123456789

6.6 Contextuals

→ v1.9: This feature used to be called Swashes. This name still works, for now.

This feature refers to glyph substitution that vary by their position; things like contextual swashes are implemented here ←. The options for AAT fonts are WordInitial, WordFinal, LineInitial, LineFinal, and Inner (also called ‘non-final’ sometimes). As non-exclusive selectors, like the ligatures, you can turn them off by prefixing their name with No.

<i>where is all the vegemite</i>	\newfontface\fancy [Contextuals={WordInitial,WordFinal}] {Hoefler Text Italic} \fancy where is all the vegemite
----------------------------------	--

‘Inner’ swashes can <i>fometimes</i> contain the archaic long s.	\fontspec[Contextuals=Inner]{Hoefler Text} ‘Inner’ swashes can \emph{sometimes} \\ contain the archaic long~s.
--	--

→ v1.9: Used to be Contextual; still works.

For OpenType fonts, all features as above but the LineInitial feature are supported, and Swash turns on contextual swashes ←.

<i>Without Contextual Swashes</i>	\fontspec{Warnock Pro} \itshape Without Contextual Swashes \\ \fontspec[Contextuals=Swash]{Warnock Pro}
<i>With Contextual Swashes; cf. W C S</i>	With Contextual Swashes; cf. W C S

Historic forms (e.g., long s as shown above) are accessed in OpenType fonts via the feature `Style=Historic`; this is generally *not* contextual in OpenType, which is why it is not included here.

6.7 Vertical position

The `VerticalPosition` feature is used to access things like subscript (`Superior`) and superscript (`Inferior`) numbers and letters (and a small amount of punctuation, sometimes). The `Ordinal` option is (supposed to be) contextually sensitive to only raise characters that appear directly after a number.

	<code>\fontspec{Skia}</code>
	Normal
Normal	<code>\fontspec[VerticalPosition=Superior]{Skia}</code>
^{superior}	Superior
_{inferior}	<code>\fontspec[VerticalPosition=Inferior]{Skia}</code>
	Inferior
	<code>\fontspec[VerticalPosition=Ordinal]{Skia}</code>
1 st 2 nd 3 rd 4 th 0 th 8abcde	1st 2nd 3rd 4th 0th 8abcde

OpenType fonts also have the option `ScientificInferior` which extends further below the baseline than `Inferiors`, as well as `Numerator` and `Denominator` for creating arbitrary fractions (see next section). Beware, the `Ordinal` feature will not work correctly for all OpenType fonts!

	<code>\fontspec[VerticalPosition=Superior]{Warnock Pro}</code>	
	Sup: abdehilmnorst (-\$12,345.67)	<code>\</code>
Sup: abdehilmnorst (-\$12,345.67)	<code>\fontspec[VerticalPosition=Numerator]{Warnock Pro}</code>	
Numerator: 12345	Numerator: 12345	<code>\</code>
	<code>\fontspec[VerticalPosition=Denominator]{Warnock Pro}</code>	
Denominator: 12345	Denominator: 12345	<code>\</code>
	<code>\fontspec[VerticalPosition=ScientificInferior]{Warnock Pro}</code>	
Scientific Inferior: 12345	Scientific Inferior: 12345	<code>\</code>
'Ordinals': 1 st 2 nd 3 rd 4 th 0 th	<code>\fontspec[VerticalPosition=Ordinal]{Warnock Pro}</code>	
	'Ordinals': 1st 2nd 3rd 4th 0th	

The `xltxtra` package redefines the `\textsubscript` and `\textsuperscript` commands to use the above font features.

6.8 Fractions

Many fonts come with the capability to typeset various forms of fractional material. This is accessed in `fontspec` with the `Fractions` feature, which may be turned `On` or `Off` in both AAT and OpenType fonts. ←

→ v1.7: This feature has changed:
no backwards compatibility!

In AAT fonts, the 'fraction slash' or solidus character, which may be obtained by typing `'\c 1'`, is (supposed) to be used to create fractions. When `Fractions` are turned `On`, then (supposedly) only pre-drawn fractions will be used.

½ 5/6
1/2 5/6

```
\fontspec[Fractions=On]{Palatino}
1/2 \quad 5/6 \\ % fraction slash
1/2 \quad 5/6 % regular slash
```

Using the `Diagonal` option (AAT only), the font will attempt to create the fraction from superscript and subscript characters. This is shown in the following example by Hoefler Text, whose fraction support may actually not be turned off.

13579/24680
13579/24680

```
\fontspec{Hoefler Text}
13579 24680 \\ % fraction slash
\quad 13579/24680 % regular slash
```

OpenType fonts simply use a regular text slash to create fractions:

1/2 1/4 5/6 13579/24680
½ ¼ ⅝ 13579/24680

```
\fontspec{Hiragino Maru Gothic Pro W4}
1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\
\addfontfeature{Fractions=On}
1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\
```

Some (Asian fonts predominantly) also provide for the `Alternate` feature:

1/2 1/4 5/6 13579/24680
½ ¼ ⅝ 13579/24680

```
\fontspec{Hiragino Maru Gothic Pro W4}
1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\
\addfontfeature{Fractions=Alternate}
1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\
```

The `xltxtra` package provides a `\vfrac` command for creating arbitrary so-called ‘vulgar’ fractions:

13579/24680

```
\fontspec{Warnock Pro}
\vfrac{13579}{24680}
```

6.9 Variants

The `Variant` feature takes a single numerical input for choosing different alphabetic shapes. Don’t mind my fancy example :) I’m just looping through the nine (!) variants of Zapfino.

```
\newcounter{var}\newcounter{trans}
\whiledo{\value{var}<9}{%
\stepcounter{trans}%
\fontspec[Variant=\thevar,
Colour=005599\thetrans\thetrans]{Zapfino}%
\makebox[0.75\width]{d}%
\stepcounter{var}}
```

For OpenType fonts, `Variant` selects a ‘Stylistic Set’, again specified numerically. I don’t have a font to demonstrate this feature with, unfortunately. See Section 7 on page 27 for a way to assign names to variants, which should be done on a per-font basis.

6.10 AAT Alternates

Selection of Alternates in AAT fonts *again* must be done numerically.

<i>Sphinx Of Black Quartz, JUDGE My Vow</i>	<code>\fontspec[Alternate=0]{Hoefler Text Italic}</code>
<i>Sphinx Of Black Quartz, JUDGE Mr</i>	<code>Sphinx Of Black Quartz, {\scshape Judge My Vow} \</code>
<i>Vow</i>	<code>\fontspec[Alternate=1]{Hoefler Text Italic}</code>
	<code>Sphinx Of Black Quartz, {\scshape Judge My Vow}</code>

See Section 7 on page 27 for a way to assign names to alternates, which should be done on a per-font basis.

6.11 Style

→ v1.7: The old name, `StyleOptions`, still works. The options of the Style feature ← are defined in AAT as one of the following: Display, Engraved, IlluminatedCaps, Italic, Ruby,⁷ TallCaps, or TitlingCaps.

<i>[ABCD...WXYZ]</i>	<code>\newfontface\officedoor[Style=Engraved]{Hoefler Text}</code>
	<code>\officedoor [ABCD\dots WXYZ]</code>

ICU supported options are Alternate, Italic, Historic, Ruby,⁷ Swash, TitlingCaps, HorizontalKana, and VerticalKana.

<i>KQRkvw y</i>	<code>\fontspec{Warnock Pro}</code>
<i>KQRkvw y</i>	<code>K Q R k v w y \</code>
<i>KQRkvw y</i>	<code>\addfontfeature{Style=Alternate}</code>
	<code>K Q R k v w y</code>

Note the occasional inconsistency with which font features are labelled; a long-tailed 'Q' could turn up anywhere!

<i>MQZ</i>	<code>\fontspec{Adobe Jenson Pro}</code>
<i>MQZ</i>	<code>M Q Z \</code>
<i>MQZ</i>	<code>\addfontfeature{Style=Historic}</code>
	<code>M Q Z</code>

<i>TITLING CAPS</i>	<code>\fontspec{Adobe Garamond Pro}</code>
<i>TITLING CAPS</i>	<code>TITLING CAPS \</code>
<i>TITLING CAPS</i>	<code>\addfontfeature{Style=TitlingCaps}</code>
	<code>TITLING CAPS</code>

Two features in one example; Italic affects the Latin text and Ruby the Japanese:

<i>Latin ようこそ ワカヨタレソ</i>	<code>\fontspec{Hiragino Mincho Pro W3}</code>
<i>Latin ようこそ ワカヨタレソ</i>	<code>Latin ようこそ ワカヨタレソ \</code>
<i>Latin ようこそ ワカヨタレソ</i>	<code>\addfontfeature{Style={Italic, Ruby}}</code>
	<code>Latin ようこそ ワカヨタレソ</code>

Note the difference here between the default and the horizontal style kana:

⁷'Ruby' refers to a small optical size, used in Japanese typography for annotations.

ようこそ ワカヨタレソ
 ようこそ ワカヨタレソ
 ようこそ ワカヨタレソ

```
\fontspec{Hiragino Mincho Pro}
ようこそ ワカヨタレソ \\
{\addfontfeature{Style=HorizontalKana}
ようこそ ワカヨタレソ} \\
{\addfontfeature{Style=VerticalKana}
ようこそ ワカヨタレソ}
```

6.12 Diacritics

Diacritics refer to characters that include extra marks that usually indicate pronunciation; *e.g.*, accented letters. You may either choose to Show, Hide or Decompose them in AAT fonts.

Some fonts include *O/ etc.* as diacritics for writing Ø. You'll want to turn this feature off (imagine typing hello/goodbye and getting 'helløgoodbye' instead!) by decomposing the two characters in the diacritic into the ones you actually want. I would recommend using the proper T_EX input conventions for obtaining such characters instead.

Ó Ö Ø
 O' O" O/
 Better: Ó Ö Ø

```
\fontspec[Diacritics=Show]{Palatino}
O' \quad O" \quad O/ \par
\fontspec[Diacritics=Decompose]{Palatino}
O' \quad O" \quad O/ \par
Better: \'0 \"0 \0 % (requires xunicode)
```

The Hide option is for Arabic-like fonts which may be displayed either with or without vowel markings.

No options for OpenType fonts.

6.13 Kerning

Well designed fonts contain kerning information that controls the spacing between letter pairs, on an individual basis. The Kerning feature provides options to control this, for OpenType fonts only.

The options provided for now are On, Off (don't know why you'd want to), and Uppercase.

Ta AV
 Ta AV

```
\fontspec{Warnock Pro}
Ta AV \\
\fontspec[Kerning=Off]{Warnock Pro}
Ta AV
```

As briefly mentioned previously at the end of Section 6.4 on page 17, the Uppercase option will add a small amount of tracking between uppercase letters:

UPPER-CASE EXAMPLE
 UPPER-CASE EXAMPLE

```
\fontspec{Warnock Pro}
UPPER-CASE EXAMPLE \\
\addfontfeature{Kerning=Uppercase}
UPPER-CASE EXAMPLE
```

6.14 CJK shape

There have been many standards for how CJK ideographic glyphs are ‘supposed’ to look. Some fonts will contain many alternate glyphs available in order to be able to display these glyphs correctly in whichever form is appropriate. Both AAT and OpenType fonts support the following CJKShape options ←: Traditional, Simplified, JIS1978, JIS1983, JIS1990, and Expert. OpenType also supports the NLC option.

→ v1.9: Was CharacterShape, which wasn't very descriptive. No backwards compatibility.

啞嚙軀 妍并訝
啞嚙軀 妍并訝
啞嚙軀 妍并訝

```
\fontspec{Hiragino Mincho Pro}
{\addfontfeature{CJKShape=Traditional}
  啞嚙軀 妍并訝 } \\
{\addfontfeature{CJKShape=NLC}
  啞嚙軀 妍并訝 } \\
{\addfontfeature{CJKShape=Expert}
  啞嚙軀 妍并訝 }
```

6.15 Character width

Many Asian fonts are equipped with variously spaced characters for shoe-horning into their generally monospaced text. These are accessed through the CharacterWidth feature.⁸ ← For now, OpenType and AAT share the same six options for this feature: Proportional, Full, Half, Third, Quarter, AlternateProportional, and AlternateHalf. AAT also allows Default to return to whatever was originally specified.

Japanese alphabetic glyphs (in Hiragana or Katakana) may be typeset proportionally, to better fit horizontal measures, or monospaced, to fit into the rigid grid imposed by ideographic typesetting. In this latter case, there are also half-width forms for squeezing more kana glyphs (which are less complex than the kanji they are amongst) into a given block of space. The same features are given to roman letters in Japanese fonts, for typesetting foreign words in the same style as the surrounding text.

→ v1.9: Was TextSpacing, which wasn't very descriptive. No backwards compatibility.

			\def\test{\makebox[2cm][l]{ようこそ}%
			\makebox[2.5cm][l]{ワカヨタレソ}%
			\makebox[2.5cm][l]{abcdef}}
ようこそ	ワカヨタレソ	abcdef	\fontspec{Hiragino Mincho Pro}
ようこそ	ワカヨタレソ	a b c d e f	{\addfontfeature{CharacterWidth=Proportional}\test} \\
ようこそ	ワカヨタレソ	abcdef	{\addfontfeature{CharacterWidth=Full}\test} \\
			{\addfontfeature{CharacterWidth=Half}\test}

⁸Apple seems to be adapting its AAT features in this regard (at least in the fonts it distributes with Mac OS X) to have a one-to-one correspondence with the equivalent OpenType features. Previously AAT was more fine grained, but naturally they're not documenting their AAT tables any more, so if the following features don't work for a specific font let me know and I'll try and see if anything can be salvaged from the situation.

The same situation occurs with numbers, which are provided in increasingly illegible compressed forms:

<p>— 1 2 3 2 1 — -1234554321- -123456787654321- -12345678900987654321-</p>	<pre>\fontspec[Renderer=AAT]{Hiragino Mincho Pro} {\addfontfeature{CharacterWidth=Full} ---12321---}\ {\addfontfeature{CharacterWidth=Half} ---1234554321---}\ {\addfontfeature{CharacterWidth=Third} ---123456787654321---}\ {\addfontfeature{CharacterWidth=Quarter} ---12345678900987654321---}</pre>
---	--

The option `CharacterWidth=Full` doesn't work with the default OpenType font renderer (ICU) due to a bug in the Hiragino fonts.

6.16 Annotation

Various Asian fonts are equipped with a more extensive range of numbers and numerals in different forms. These are accessed through the Annotation feature with the following options: `Off`, `Box`, `RoundedBox`, `Circle`, `BlackCircle`, `Parenthesis`, `Period`, `RomanNumerals`, `Diamond`, `BlackSquare`, `BlackRoundSquare`, and `DoubleCircle`.

<p>1 2 3 4 5 6 7 8 9 ① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨ (1) (2) (3) (4) (5) (6) (7) (8) (9) 1. 2. 3. 4. 5. 6. 7. 8. 9.</p>	<pre>\fontspec{Hei Regular} 1 2 3 4 5 6 7 8 9 \fontspec[Annotation=Circle]{Hei Regular} 1 2 3 4 5 6 7 8 9 \fontspec[Annotation=Parenthesis]{Hei Regular} 1 2 3 4 5 6 7 8 9 \fontspec[Annotation=Period]{Hei Regular} 1 2 3 4 5 6 7 8 9</pre>
--	--

For OpenType fonts, the only option supported is `On` and `Off`:

<p>1 2 3 4 5 6 7 8 9 (1) (2) (3) (4) (5) (6) (7) (8) (9)</p>	<pre>\fontspec{Hiragino Maru Gothic Pro} 1 2 3 4 5 6 7 8 9 \addfontfeature{Annotation=On} 1 2 3 4 5 6 7 8 9</pre>
---	---

I'm not sure if $X_{\text{H}}\text{T}_{\text{E}}\text{X}$ can access alternate annotation forms, even if they exist (as in this case) in the font.

6.17 Vertical typesetting

A recent feature of $X_{\text{H}}\text{T}_{\text{E}}\text{X}$ is the ability to rotate the glyphs in AAT fonts by 90° , providing a method to typeset vertically by building a horizontal box as normal and then rotating it.

共產主義者は

共
産
主
義
者
は

```
\fontspec{Hiragino Mincho Pro}
共產主義者は
```

```
\fontspec[Renderer=AAT,Vertical=RotatedGlyphs]{Hiragino Mincho Pro}
\rotatebox{-90}{共產主義者は}% requires the graphicx package
```

The AAT renderer is required above because X_YTeX choses the ICU renderer by preference when both options are available; if it is not explicitly chosen, the glyphs will not be rotated and a warning will be printed in the output.

No actual provision is made for typesetting top-to-bottom languages; for an example of how to do this, see the vertical Chinese example provided in the X_YTeX documentation.

6.18 AAT & Multiple Master font axes

Multiple Master and AAT font specifications both provide continuous variation along font parameters. For example, they don't have just regular and bold weights, they can have any bold weight you like between the two extremes.

Weight, Width, and OpticalSize are supported by this package. Skia, which is distributed with Mac OS X, has two of these variable parameters, allowing for a demonstration:

Really light and extended Skia	\fontspec[Weight=0.5,Width=3]{Skia}	Really light and extended Skia	\
Really fat and condensed Skia	\fontspec[Weight=2,Width=0.5]{Skia}	Really fat and condensed Skia	

Variations along a multiple master font's optical size axis has been shown previously in Section 6.2 on page 15.

6.19 OpenType scripts and languages

When dealing with fonts that include glyphs for various languages, they may contain different font features for the different character sets and languages it supports. These may be selected with the Script and Language features. The possible options are tabulated in Table 2 on page 27 and Table 3 on page 28, respectively. When a script or language is requested that is not supported by the current font, a warning is printed in the console output.

Because these font features can change which features are able to be selected for the font, they are selected by fontspec before all others and will specifically select the ICU renderer for this font, as described in Section 6.1 on page 15.

6.19.1 Script examples

In the following examples, the same font is used to typeset the verbatim input and the X_YTEX output. Because the `Script` is only specified for the output, the text is rendered incorrectly in the verbatim input. Many examples of incorrect diacritic spacing as well as a lack of contextual ligatures and rearrangement can be seen. Thanks to Jonathan Kew, Yves Codet and Gildas Hamel for their contributions towards these examples.

العربي	<code>\fontspec[Script=Arabic]{Code2000}</code> العر بي
हिन्दी	<code>\fontspec[Script=Devanagari]{Code2000}</code> हिन्दी
লেখ	<code>\fontspec[Script=Bengali]{Code2000}</code> লেখ
મયાદા-સૂચક નિવેદન	<code>\fontspec[Script=Gujarati]{Code2000}</code> મયાદા-સૂચક નિવેદન
നമുടെ പാരമ്പര്യ	<code>\fontspec[Script=Malayalam]{Code2000}</code> നമുടെ പാരമ്പര്യ
ਆਦਿ ਸਚੁ ਜੁਗਾਦਿ ਸਚੁ	<code>\fontspec[Script=Gurmukhi]{Code2000}</code> ਆਦਿ ਸਚੁ ਜੁਗਾਦਿ ਸਚੁ
தமிழ் தேடி	<code>\fontspec[Script=Tamil]{Code2000}</code> தமிழ் தேடி
תּוֹרָה	<code>\fontspec[Script=Hebrew]{Code2000}</code> תּוֹרָה

6.19.2 Language examples

Vietnamese requires careful diacritic placement:

cáp số mỗĩ	<code>\fontspec{Doulos SIL}</code> cáp số mỗĩ \\
cấp số mỗĩ	<code>\addfontfeature{Language=Vietnamese}</code> cấp số mỗĩ

Moldavian, as a typical example from Ralf Stubner's FPL Neu font:

Ș ș Ţ ț	<code>\fontspec{FPL Neu}</code> Ș ș Ţ ț \\
Ș ș Ţ ț	<code>\addfontfeature{Language=Moldavian}</code> Ș ș Ţ ț

6.19.3 Defining new scripts and languages

`\newfontscript` Further scripts and languages may be added with the `\newfontscript` and `\newfontlanguage` commands. For example,

```
\newfontscript{Arabic}{arab}
\newfontlanguage{Turkish}{TUR}
```

The first argument is the fontspec name, the second the OpenType definition. The advantage to using these commands rather than `\newfontfeature` (see Section 7) is the error-checking that is performed when the script or language is requested.

Arabic	Ethiopic	Limbu	Sumero-Akkadian

Table 2: Defined Scripts for OpenType fonts. Aliased names are shown in adjacent positions marked with red pilcrows (◄), defined in `fontspec.cfg`.

7 Defining new features

This package cannot hope to contain every possible font feature. Three commands are provided for selecting font features that are not provided for out of the box. If you are using them a lot, chances are I've left something out, so please let me know.

`\newAATfeature` New AAT features may be created with this command:

```
\newAATfeature{<feature>}{<option>}{<feature code>}{<selector code>}
```

Use the X_YTeX file `AAT-info.tex` to obtain the code numbers. For example:

```
\newAATfeature{Alternate}{HoeflerSwash}{17}{1}
This is XeTeX by Jonathan Kew. \fontspec[Alternate=HoeflerSwash]{Hoefler Text Italic}
This is XeTeX by Jonathan Kew.
```

This command replaces `\newfontfeaturecode`, which is provided for backwards compatibility via `fontspec.cfg`.

Table 3: Defined Languages for OpenType fonts. Note that they are sorted alphabetically *not* by name but by OpenType tag, which is a little irritating, really.

`\newICUfeature` New OpenType features may be created with this command:
`\newICUfeature{<feature>}{<option>}{<feature tag>}`
 In the following example, the Moldavian language (see Section 6.19 on page 25) must be activated to achieve the effect shown.

	<pre> \newICUfeature{Style}{NoLocalForms}{-loc1} \fontspec[Language=Moldavian]{FPL Neu} Ş ş Ţ ţ \ \addfontfeature{Style=NoLocalForms} Ș ș Ț ț </pre>
---	--

`\newfontfeature` In case the above commands do not accommodate the desired font feature (perhaps a new X_YT_EX feature that `fontspec` hasn't been updated to support), a command is provided to pass arbitrary input into the font selection string:

`\newfontfeature{<name>}{<input string>}`

For example, Zapfino contains the feature 'Avoid d-collisions'. To access it with this package, you could do the following:

	<pre> \newfontfeature{AvoidD}{Special=Avoid d-collisions} \newfontfeature{NoAvoidD}{Special=!Avoid d-collisions} \fontspec[AvoidD,Variant=1]{Zapfino} sockdolager rubdown \ \fontspec[NoAvoidD,Variant=1]{Zapfino} sockdolager rubdown </pre>
--	---

The advantage to using the `\newAATfeature` and `\newICUfeature` commands is that they check if the selected font actually contains the font feature. By contrast, `\newfontfeature` will not give a warning for improper input.

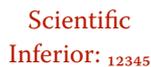

7.1 Renaming existing features & options

`\aliasfontfeature` If you don't like the name of a particular font feature, it may be aliased to another with the `\aliasfontfeature{<existing name>}{<new name>}` command:

	<pre> \aliasfontfeature{ItalicFeatures}{IF} \fontspec[IF = {Alternate=1}]{Hoefler Text} Roman Letters \itshape And Swash </pre>
---	---

Spaces in feature (and option names, see below) *are* allowed. (You may have noticed this already in the lists of OpenType scripts and languages).

`\aliasfontfeatureoption` If you wish to change the name of a font feature option, it can be aliased to another with the command `\aliasfontfeatureoption{}{<existing name>}{<new name>}`:

	<pre> \aliasfontfeature{VerticalPosition}{Vert Pos} \aliasfontfeatureoption{VerticalPosition}{ScientificInferior}{Sci Inf} \fontspec[Vert Pos=Sci Inf]{Warnock Pro} Scientific Inferior: 12345 </pre>
---	---

This example demonstrates an important point: when aliasing the feature options, the *original* feature name must be used when declaring to which feature the option belongs.

Only feature options that exist as sets of fixed strings may be altered in this way. That is, `Proportional` can be aliased to `Prop` in the `Letters` feature, but `550099BB` cannot be substituted for `Purple` in a `Colour` specification. For this type of thing, the `\newfontfeature` command should be used to declare a new, e.g., `PurpleColour` feature:

```
\newfontfeature{PurpleColour}{color=550099BB}
```

7.2 Going behind fontspec's back

Expert users may wish not to use `fontspec`'s feature handling at all, while still taking advantage of its L^AT_EX font selection conveniences. The `RawFeature` ← font feature allows literal X_YL^AT_EX font feature selection when you happen to have the OpenType feature tag memorised.

```
FPL NEU SMALL CAPS           \fontspec[RawFeature=+smcp]{FPL Neu}
                               FPL Neu small caps
```

Multiple features can either be included in a single declaration:

```
[RawFeature=+smcp;+onum]
```

or with multiple declarations:

```
[RawFeature=+smcp, RawFeature=+onum]
```

File I

fontspec.sty

8 Implementation

Herein lie the implementation details of this package. Welcome! It's my first.

For some reason, I decided to prefix all the package internal command names and variables with `zf`. I don't know why I chose those letters, but I guess I just liked the look/feel of them together at the time. (Possibly inspired by Hermann Zapf.)

Only proceed if it is \XeTeX that is doing the typesetting.

```
1 \RequirePackage{ifxetex}
2 \RequireXeTeX
```

8.1 Bits and pieces

Conditionals

```
3 \newif\ifzf@firsttime
4 \newif\ifzf@nobf
5 \newif\ifzf@noit
6 \newif\ifzf@nosc
7 \newif\ifzf@tfm
8 \newif\ifzf@atsui
9 \newif\ifzf@icu
10 \newif\ifzf@mm
```

For dealing with legacy maths

```
11 \newif\ifzf@math@euler
12 \newif\ifzf@math@lucida
13 \newif\ifzf@package@euler@loaded
```

For, well, dealing with babel:

```
14 \newif\ifzf@package@babel@loaded
```

For package options:

```
15 \newif\if@zf@configfile
16 \newif\if@zf@euenc
```

Counters

```
17 \newcount\c@zf@newff
18 \newcount\c@zf@index
19 \newcount\c@zf@script
20 \newcount\c@zf@language
```

fontspec shorthands:

```
21 \newcommand\zf@PackageError[2]{\PackageError{fontspec}{#1}{#2}}
22 \newcommand\zf@PackageWarning[1]{\PackageWarning{fontspec}{#1}}
23 \newcommand\zf@PackageInfo[1]{\PackageInfo{fontspec}{#1}}
```

\def@cx L^AT_EX₃-like syntax for various low level commands. Makes life much easier; can't wait for the official interface :)

```
\gdef@cx
\let@cc 24 \providecommand\def@cx[2]{\expandafter\edef\csname#1\endcsname{#2}}
25 \providecommand\gdef@cx[2]{\expandafter\xdef\csname#1\endcsname{#2}}
26 \providecommand\let@cc[2]{%
27 \expandafter\let\csname#1\expandafter\endcsname\csname#2\endcsname}
```

8.2 Option processing

```
28 \DeclareOption{cm-default}{\zf@euencfalse}
29 \DeclareOption{lm-default}{\zf@euenctrue}
30 \DeclareOption{config}{\zf@configfiletrue}
31 \DeclareOption{noconfig}{\zf@configfilefalse}
32 \DeclareOption{quiet}{\let\zf@PackageWarning\zf@PackageInfo}
33 \ExecuteOptions{config,lm-default}
34 \ProcessOptions*
```

Only proceed if it is X_YT_EX that is doing the typesetting.

```
35 \RequirePackage{ifxetex}
36 \RequireXeTeX
```

8.3 Packages

We require the calc package for autoscaling and a recent version of the xkeyval package for option processing.

```
37 \RequirePackage{calc}
38 \RequirePackage{xkeyval}[2005/05/07]
```

8.4 Encodings

Frank Mittelbach has recommended using the 'EUx' family of font encodings to experiment with unicode. Now that X_YT_EX can find fonts in the texmf tree, the Latin Modern OpenType fonts can be used as the defaults. See the euenc collection of files for how this is implemented.

```
39 \if@zf@euenc
40 \def\zf@enc{EU1}
41 \RequirePackage{lmodern}
42 \RequirePackage[\zf@enc]{fontenc}
43 \else
44 \def\zf@enc{U}
45 \let\encodingdefault\zf@enc
46 \fi
```

```
47 \let\UTFencname\zf@enc
```

Dealing with a couple of the problems introduced by babel:

```
48 \let\cyrillicencoding\zf@enc
49 \let\latinencoding\zf@enc
50 \g@addto@macro\document{%
51   \let\cyrillicencoding\zf@enc
52   \let\latinencoding\zf@enc}
```

That latin encoding definition is repeated to suppress font warnings. Something to do with `\select@language` ending up in the `.aux` file which is read at the beginning of the document.

8.5 User commands

This section contains the definitions of the commands detailed in the user documentation. Only the ‘top level’ definitions of the commands are contained herein; they all use or define macros which are defined or used later on in Section 8.6 on page 37.

8.5.1 Font selection

`\fontspec` This is the main command of the package that selects fonts with various features. It takes two arguments: the Mac OS X font name and the optional requested features of that font. It simply runs `\zf@fontspec`, which takes the same arguments as the top level macro and puts the new-fangled font family name into the global `\zf@family`. Then this new font family is selected.

```
53 \newcommand*\fontspec[2] [] {%
54   \zf@fontspec{#1}{#2}%
55   \fontfamily\zf@family\selectfont
56   \ignorespaces}
```

`\setmainfont` `\setsansfont` `\setmonofont` The following three macros perform equivalent operations setting the default font (using `\let` rather than `\renewcommand` because `\zf@family` will change in the future) for a particular family: ‘roman’, sans serif, or typewriter (monospaced). I end them with `\normalfont` so that if they’re used in the document, the change registers immediately.

```
57 \newcommand*\setmainfont[2] [] {%
58   \zf@fontspec{#1}{#2}%
59   \let\rmdefault\zf@family
60   \normalfont}
61 \let\setromanfont\setmainfont
62 \newcommand*\setsansfont[2] [] {%
63   \zf@fontspec{#1}{#2}%
64   \let\sfddefault\zf@family
65   \normalfont}
```

```

66 \newcommand*\setmonofont[2][]{%
67   \zf@fontspec{#1}{#2}%
68   \let\ttdefault\zf@family
69   \normalfont}

```

`\setmathrm` These commands are analogous to `\setromanfont` and others, but for selecting the font used for `\mathrm`, *etc.* They can only be used in the preamble of the document. `\setboldmathrm` is used for specifying which fonts should be used in `\boldmath`.

```

70 \newcommand*\setmathrm[2][]{%
71   \zf@fontspec{#1}{#2}%
72   \let\zf@rmmaths\zf@family}
73 \newcommand*\setboldmathrm[2][]{%
74   \zf@fontspec{#1}{#2}%
75   \let\zf@rmboldmaths\zf@family}
76 \newcommand*\setmathsf[2][]{%
77   \zf@fontspec{#1}{#2}%
78   \let\zf@sfmaths\zf@family}
79 \newcommand*\setmathtt[2][]{%
80   \zf@fontspec{#1}{#2}%
81   \let\zf@ttmaths\zf@family}
82 \@onlypreamble\setmathrm
83 \@onlypreamble\setboldmathrm
84 \@onlypreamble\setmathsf
85 \@onlypreamble\setmathtt

```

If the commands above are not executed, then `\rmdefault` (*etc.*) will be used.

```

86 \def\zf@rmmaths{\rmdefault}
87 \def\zf@sfmaths{\sfdefault}
88 \def\zf@ttmaths{\ttdefault}

```

`\newfontfamily` This macro takes the arguments of `\fontspec` with a prepended (*instance cmd*) `\newfontface` (code for middle optional argument generated by Scott Pakin's `newcommand.py`). This command is used when a specific font instance needs to be referred to repetitively (*e.g.*, in a section heading) since continuously calling `\zf@fontspec` is inefficient because it must parse the option arguments every time.

`\zf@fontspec` defines a font family and saves its name in `\zf@family`. This family is then used in a typical NFSS `\fontfamily` declaration, saved in the macro name specified.

```

89 \newcommand*\newfontfamily[1]{%
90   \@ifnextchar[{\newfontfamily@i#1}{\newfontfamily@i#1[]}}
91 \def\newfontfamily@i#1[#2]#3{%
92   \zf@fontspec{#2}{#3}%
93   \edef\@tempa{%
94     \noexpand\DeclareRobustCommand\noexpand#1
95     {\noexpand\fontfamily{\zf@family}\noexpand\selectfont}}%
96   \@tempa}

```

`\newfontface` uses an undocumented feature of the `BoldFont` feature; if its argument is empty (*i.e.*, `BoldFont={}`), then no bold font is searched for.

```

97 \newcommand*\newfontface[1]{%
98   \@ifnextchar[{\newfontface@i#1}{\newfontface@i#1[]}]
99 \def\newfontface@i#1[#2]#3{%
100   \zf@fontspec{BoldFont={},ItalicFont={},SmallCapsFont={},#2}{#3}%
101   \edef\@tempa{%
102     \noexpand\DeclareRobustCommand\noexpand#1
103     {\noexpand\fontfamily{\zf@family}\noexpand\selectfont}}%
104   \@tempa}

```

8.5.2 Font feature selection

`\defaultfontfeatures` This macro takes one argument that consists of all of feature options that will be applied by default to all subsequent `\fontspec`, et al., commands. It stores its value in `\zf@default@options` (initialised empty), which is concatenated with the individual macro choices in the `\zf@get@feature@requests` macro.

```

105 \newcommand*\defaultfontfeatures[1]{\def\zf@default@options{#1,}}
106 \let\zf@default@options\@empty

```

`\addfontfeatures` In order to be able to extend the feature selection of a given font, two things need to be known: the currently selected features, and the currently selected font. Every time a font family is created, this information is saved inside a control sequence with the name of the font family itself.

This macro extracts this information, then appends the requested font features to add to the already existing ones, and calls the font again with the top level `\fontspec` command.

The default options are *not* applied (which is why `\zf@default@options` is emptied inside the group; this is allowed as `\zf@family` is globally defined in `\zf@fontspec`), so this means that the only added features to the font are strictly those specified by this command.

`\addfontfeature` is defined as an alias, as I found that I often typed this instead when adding only a single font feature.

```

107 \newcommand*\addfontfeatures[1]{%
108   \begingroup
109     \let\zf@default@options\@empty
110     \edef\@tempa{%
111       \noexpand\zf@fontspec
112       {\csname zf@family@options\f@family\endcsname,#1}%
113       {\csname zf@family@fontname\f@family\endcsname}}%
114     \@tempa
115   \endgroup
116   \fontfamily\zf@family\selectfont
117   \ignorespaces}
118 \let\addfontfeature\addfontfeatures

```

8.5.3 Defining new font features

`\newfontfeature` `\newfontfeature` takes two arguments: the name of the feature tag by which to reference it, and the string that is used to select the font feature. It uses a counter to keep track of the number of new features introduced; every time a new feature is defined, a control sequence is defined made up of the concatenation of `+zf-` and the new feature tag. This long-winded control sequence is then called upon to update the font family string when a new instance is requested.

```
119 \newcommand*\newfontfeature[2]{%
120   \stepcounter{zf@newff}%
121   \def@cx{+zf-#1}{+zf-\the\c@zf@newff}%
122   \define@key[zf]{options}{#1}[]{%
123     \zf@update@family{\csname+zf-#1\endcsname}%
124     \zf@update@ff{#2}}
```

`\newAATfeature` This command assigns a new AAT feature by its code (`#2,#3`) to a new name (`#1`). Better than `\newfontfeature` because it checks if the feature exists in the font it's being used for.

```
125 \newcommand*\newAATfeature[4]{%
126   \unless\ifcsname zf@options@#1\endcsname
127     \zf@define@font@feature{#1}%
128   \fi
129   \key@ifundefined[zf]{#1}{#2}{%
130     \zf@PackageWarning{Option '#2' of font feature '#1' overwritten.}}%
131   \zf@define@feature@option{#1}{#2}{#3}{#4}}
```

`\newICUfeature` This command assigns a new OpenType feature by its abbreviation (`#2`) to a new name (`#1`). Better than `\newfontfeature` because it checks if the feature exists in the font it's being used for.

```
132 \newcommand*\newICUfeature[3]{%
133   \unless\ifcsname zf@options@#1\endcsname
134     \zf@define@font@feature{#1}%
135   \fi
136   \key@ifundefined[zf]{#1}{#2}{%
137     \zf@PackageWarning{Option '#2' of font feature '#1' overwritten.}}%
138   \zf@define@feature@option{#1}{#2}{#3}}
```

`\aliasfontfeature` `\aliasfontfeature` and `\aliasfontfeatureoption` User commands for renaming font features and font feature options. Provided I've been consistent, they should work for everything.

```
139 \newcommand*\aliasfontfeature[2]{\multi@alias@key{#1}{#2}}
140 \newcommand*\aliasfontfeatureoption[3]{\keyval@alias@key[zf@feat]{#1}{#2}{#3}}
```

`\newfontscript` Mostly used internally, but also possibly useful for users, to define new OpenType 'scripts', mapping logical names to OpenType script tags. Iterates through the scripts in the selected font to check that it's a valid feature choice, and then

prepends the (X_YT_EX) `\font` feature string with the appropriate script selection tag.

```

141 \newcommand*\newfontscript[2]{%
142   \define@key[zf@feat]{Script}{#1}[]{}%
143   \zf@check@ot@script{#2}%
144   \if@tempswa
145     \global\c@zf@script\@tempcnta\relax
146     \xdef\zf@script@name{#1}%
147     \xdef\zf@family@long{\zf@family@long+script=#1}%
148     \xdef\zf@pre@ff{script=#2,\zf@pre@ff}%
149   \else
150     \zf@PackageWarning{Font \fontname\zf@basefont does not con-
151     tain script '#1'}%
152   \fi}}

```

`\newfontlanguage` Mostly used internally, but also possibly useful for users, to define new OpenType ‘languages’, mapping logical names to OpenType language tags. Iterates through the languages in the selected font to check that it’s a valid feature choice, and then prepends the (X_YT_EX) `\font` feature string with the appropriate language selection tag.

```

152 \newcommand*\newfontlanguage[2]{%
153   \define@key[zf@feat]{Lang}{#1}[]{}%
154   \zf@check@ot@lang{#2}%
155   \if@tempswa
156     \global\c@zf@language\@tempcnta\relax
157     \xdef\zf@language@name{#1}%
158     \xdef\zf@family@long{\zf@family@long+lang=#1}%
159     \xdef\zf@pre@ff{\zf@pre@ff language=#2,}%
160   \else
161     \zf@PackageWarning{Font \fontname\zf@basefont does not contain
162     language '#1' for script '\zf@script@name'}%
163   \fi}}

```

8.6 Internal macros

`\zf@fontspec` This is the command that defines font families for use, the underlying procedure of all `\fontspec`-like commands. Given a list of font features (#1) for a requested font (#2, stored in `\zf@fontname` globally for the `\zf@make@aat@feature@string` macro), it will define an NFSS family for that font and put the family name into `\zf@family`.

This macro does its processing inside a group, but it’s a bit worthless coz there’s all sorts of `\global` action going on. Pity. Anyway, lots of things are branched out for the pure reason of splitting the code up into logical chunks. Some of it is never even re-used, so it all might be a bit obfuscating. (E.g., `\zf@init` and `\zf@set@font@type`.)

First off, initialise some bits and pieces and run the preparse feature processing. This catches font features such as `Renderer` that can change the way subsequent features are processed. All font features that ‘slip through’ this stage are saved in the `\zf@font@feat` macro for future processing.

```

164 \newcommand*\zf@fontspec[2]{%
165   \begingroup
166   \zf@init
167   \edef\zf@fontname{#2}%
168   \let\zf@family@long\zf@fontname
169   \setkeys*[zf]{\preparse}{#1}%
170   \edef\@tempa{\noexpand\setkeys*[zf]{\preparse}{\XKV@rm}}\@tempa
171   \let\zf@font@feat\XKV@rm

```

Now check if the font is to be rendered with ATSUI or ICU. This will either be automatic (based on the font type), or specified by the user via a font feature. If automatic, the `\zf@suffix` macro will still be empty (other suffices that could be added will be later in the feature processing), and if it is indeed still empty, assign it a value so that the other weights of the font are specifically loaded with the same renderer. This fixes a bug in v1.10 for a mishmash of Lucida fonts.

```

172 \font\zf@basefont="\zf@font@wrap\zf@fontname\zf@suffix" at \f@size pt
173 \unless\ifzf@icu
174   \zf@set@font@type
175   \fi
176 \ifx\zf@suffix\@empty
177   \ifzf@atsui
178     \def\zf@suffix{/AAT}%
179   \else
180     \ifzf@icu
181       \def\zf@suffix{/ICU}%
182     \fi
183   \fi
184 \font\zf@basefont="\zf@font@wrap\zf@fontname\zf@suffix" at \f@size pt
185 \fi

```

Now convert the remaining requested features to font definition strings. This is performed with `\zf@get@feature@requests`, in which `\setkeys` retrieves the requested font features and processes them. To build up the complex family name, it concatenates each font feature with the family name of the font. So since `\setkeys` is run more than once (since different font faces may have different feature names), we only want the complex family name to be built up once, hence the `\zf@firsttime` conditionals.

In the future, this will be replaced by a dedicated `makefamilyxkeyval\setkeys` declaration. Probably.

```

186 \zf@firsttimetrue
187   \zf@get@feature@requests{\zf@font@feat}%
188 \zf@firsttimefalse

```

Now we have a unique (in fact, too unique!) string that contains the family name and every option in abbreviated form. This is used with a counter to create a simple NFSS family name for the font we're selecting.

```

189 \unless\ifcsname zf@UID@\zf@family@Long\endcsname
190   \ifcsname c@zf@famc@#2\endcsname
191     \expandafter\stepcounter\else
192     \expandafter\newcounter\fi
193     {zf@famc@#2}%
194   \def@cx{zf@UID@\zf@family@Long}{%
195     \zap@space#2 \@empty
196     (\expandafter\the\csname c@zf@famc@#2\endcsname)}%
197   \fi
198   \xdef\zf@family{\@nameuse{zf@UID@\zf@family@Long}}%

```

Now that we have the family name, we can check to see if the family has already been defined, and if not, do so. Once the family name is created, use it to create global macros to save the user string of the requested options and font name, primarily for use with `\addfontfeatures`.

```

199 \unless\ifcsname zf@family@fontname\zf@family\endcsname
200   \zf@PackageInfo{Defining font family for "#2"
201     with options [\zf@default@options #1]}%
202   \gdef@cx{zf@family@fontname\zf@family}{\zf@fontname}%
203   \gdef@cx{zf@family@options\zf@family}{\zf@default@options #1}%
204   \gdef@cx{zf@family@fontdef\zf@family}
205     {\zf@fontname\zf@suffix:\zf@pre@ff\zf@ff}%

```

Next the font family and its shapes are defined in the NFSS.

All NFSS specifications take their default values, so if any of them are redefined, the shapes will be selected to fit in with the current state. For example, if `\bfdefault` is redefined to `b`, all bold shapes defined by this package will also be assigned to `b`.

The macros `\zf@bf`, et al., are used to store the name of the custom bold, et al., font, if requested as user options. If they are empty, the default fonts are used.

First we define the font family and define the normal shape: (any shape-specific features are appended to the generic font features requested in the last argument of `\zf@make@font@shapes`.)

```

206   \DeclareFontFamily{\zf@enc}{\zf@family}{}%
207   \zf@make@font@shapes{\zf@fontname}
208     {\mddefault}{\updefault}{\zf@font@feat\zf@up@feat}%

```

Secondly, bold. Again, the extra bold options defined with `BoldFeatures` are appended to the generic font features. Then, the bold font is defined either as the ATS default (`\zf@make@font@shapes`' optional argument is to check if there actually is one; if not, the bold NFSS series is left undefined) or with the font specified with the `BoldFont` feature.

```

209   \unless\ifzf@nobf
210     \ifx\zf@bf\@empty

```

```

211     \zf@make@font@shapes[\zf@fontname]{/B}
212         {\bfdefault}{\updefault}{\zf@font@feat\zf@bf@feat}%
213     \else
214         \zf@make@font@shapes{\zf@bf}
215         {\bfdefault}{\updefault}{\zf@font@feat\zf@bf@feat}%
216     \fi
217 \fi

```

And italic in the same way:

```

218 \unless\ifzf@noit
219 \ifx\zf@it\@empty
220     \zf@make@font@shapes[\zf@fontname]{/I}
221     {\mddefault}{\itdefault}{\zf@font@feat\zf@it@feat}%
222 \else
223     \zf@make@font@shapes{\zf@it}
224     {\mddefault}{\itdefault}{\zf@font@feat\zf@it@feat}%
225 \fi
226 \fi

```

If requested, the custom fonts take precedence when choosing the bold italic font. When both italic and bold fonts are requested and the bold italic font hasn't been explicitly specified (a rare occurrence, presumably), the new bold font is used to define the new bold italic font.

```

227 \@tempwatrue
228 \ifzf@nobf\@tempwafalse\fi
229 \ifzf@noit\@tempwafalse\fi
230 \if@tempswa
231 \ifx\zf@bfit\@empty
232 \ifx\zf@bf\@empty
233 \ifx\zf@it\@empty
234     \zf@make@font@shapes[\zf@fontname]{/BI}
235     {\bfdefault}{\itdefault}{\zf@font@feat\zf@bfit@feat}%
236 \else
237     \zf@make@font@shapes[\zf@it]{/B}
238     {\bfdefault}{\itdefault}{\zf@font@feat\zf@bfit@feat}%
239 \fi
240 \else
241     \zf@make@font@shapes[\zf@bf]{/I}
242     {\bfdefault}{\itdefault}{\zf@font@feat\zf@bfit@feat}%
243 \fi
244 \else
245     \zf@make@font@shapes{\zf@bfit}
246     {\bfdefault}{\itdefault}{\zf@font@feat\zf@bfit@feat}%
247 \fi
248 \fi
249 \fi
250 \endgroup}

```

8.6.1 Fonts

`\zf@set@font@type` This macro sets `\zf@atsui` or `\zf@icu` or `\zf@mm` booleans accordingly depending if the font in `\zf@basefont` is an AAT font or an OpenType font or a font with feature axes (either AAT or Multiple Master), respectively.

```

251 \newcommand*\zf@set@font@type{%
252   \zf@tfmfalse \zf@atsuifalse \zf@icufalse \zf@mmfalse
253   \ifcase\XeTeXfonttype\zf@basefont
254     \zf@tfm
255   \or
256     \zf@atsuitrue
257     \ifnum\XeTeXcountvariations\zf@basefont > 0
258       \zf@mmtrue
259     \fi
260   \or
261     \zf@icutrue
262   \fi}

```

`\zf@make@font@shapes` [#1]: Font name prefix
 #2 : Font name
 #3 : Font series
 #4 : Font shape
 #5 : Font features

This macro eventually uses `\DeclareFontShape` to define the font shape in question.

The optional first argument is used when making the font shapes for bold, italic, and bold italic fonts using X_YTeX's auto-recognition with #2 as /B, /I, and /BI font name suffixes. If no such font is found, it falls back to the original font name, in which case this macro doesn't proceed and the font shape is not created for the NFSS.

```

263 \newcommand*\zf@make@font@shapes[5] [] {%
264   \begingroup
265   \edef\@tempa{#1}%
266   \unless\ifx\@tempa\@empty
267     \font\@tempfonta="\zf@font@wrap{#1}\zf@suffix" at \f@size pt
268     \edef\@tempa{\fontname\@tempfonta}%
269     \fi
270     \font\@tempfontb="\zf@font@wrap{#1#2}\zf@suffix" at \f@size pt
271     \edef\@tempb{\fontname\@tempfontb}%
272     \ifx\@tempa\@tempb
273       \zf@PackageInfo{Could not resolve font #1#2 (it might not exist)}%
274     \else
275       \edef\zf@fontname{#1#2}%
276       \let\zf@basefont\@tempfontb
277       \zf@DeclareFontShape{#3}{#4}{#5}%

```

Next, the small caps are defined. `\zf@make@smallcaps` is used to define the appropriate string for activating small caps in the font, if they exist. If we are defining small caps for the upright shape, then the small caps shape default is used. For an *italic* font, however, the shape parameter is overloaded and we must call italic small caps by their own identifier. See Section 8.8 on page 64 for the code that enables this usage.

```

278     \ifx\zf@sc\@empty
279     \unless\ifzf@nosc
280     \zf@make@smallcaps
281     \unless\ifx\zf@smallcaps\@empty
282     \zf@DeclareFontShape[\zf@smallcaps]{#3}
283     {\ifx#4\itdefault\sidefault\else\scdefault\fi}{#5\zf@sc@feat}%
284     \fi
285     \fi
286     \else
287     \edef\zf@fontname{\zf@sc}%
288     \zf@DeclareFontShape{#3}
289     {\ifx#4\itdefault\sidefault\else\scdefault\fi}{#5\zf@sc@feat}%
290     \fi
291     \fi
292 \endgroup}

```

Note that the test for italics to choose the `\sidefault` shape only works while `\zf@fontspec` passes single tokens to this macro...

`\zf@DeclareFontShape` [#1]: Raw appended font feature
 #2 : Font series
 #3 : Font shape
 #4 : Font features

Wrapper for `\DeclareFontShape`.

```

293 \newcommand\zf@DeclareFontShape[4] [] {}%
294 \ifx\zf@size@feat\@empty
295 \zf@get@feature@requests{#4}%
296 \edef\zf@font@str{<->\zf@scale"\zf@font@wrap\zf@fontname\zf@suffix:%
297 \zf@pre@ff\zf@ff#1"%
298 \else

```

Default code, above, sets things up for no optical size fonts or features. On the other hand, loop through `SizeFeatures` arguments, which are of the form

`SizeFeatures={ {<one>}, {<two>}, {<three>} }`.

```

299 \@for\zf@this@size:=\zf@size@feat\do{%
300 \let\zf@size\@empty
301 \let\zf@size@fnt\zf@fontname
302 \edef\@tempa{\noexpand
303 \setkeys*[zf]{sizing}{\expandafter\@firstofone\zf@this@size}}%
304 \@tempa
305 \ifx\zf@size\@empty\zf@PackageError

```

```

306         {Size information must be supplied}
307         {For example, SizeFeatures={Size={8-12},...},...}%
308     \fi
309     \zf@get@feature@requests{#4,\XKV@rm}%
310     \edef\zf@font@str{\zf@font@str <\zf@size>%
311         \zf@scale"\zf@size@fnt\zf@suffix:\zf@pre@ff\zf@ff#1"}}%
312 \fi

```

And finally the actual font shape declaration using `\zf@font@str` defined above. `\zf@adjust` is defined in various places to deal with things like the hyphenation character and interword spacing.

```

313 \edef\@tempa{\noexpand
314     \DeclareFontShape{\zf@enc}{\zf@family}{#2}{#3}%
315     {\zf@font@str}{\zf@adjust}}%
316 \@tempa

```

This extra stuff for the slanted shape substitution is a little bit awkward, but I'd rather have it here than break out yet another macro. Alternatively, one day I might just redefine `\slshape`. Why not, eh?

```

317 \edef\@tempa{#3}%
318 \edef\@tempb{\itdefault}%
319 \ifx\@tempa\@tempb
320     \edef\@tempa{\noexpand
321         \DeclareFontShape{\zf@enc}{\zf@family}{#1}{\sldefault}
322         {<->sub*\zf@family/#2/\itdefault}{\zf@adjust}}%
323     \@tempa
324 \fi}

```

`\zf@update@family` This macro is used to build up a complex family name based on its features. `\zf@firsttime` is set true in `\zf@fontspec` only the first time `\zf@get@feature@requests` is called, so that the family name is only created once.

```

325 \newcommand*\zf@update@family[1]{%
326     \ifzf@firsttime
327         \xdef\zf@family@long{\zf@family@long#1}%
328     \fi}

```

8.6.2 Features

`\zf@get@feature@requests` This macro is a wrapper for `\setkeys` which expands and adds a default specification to the original passed options. It begins by initialising the commands used to hold font-feature specific strings.

```

329 \newcommand*\zf@get@feature@requests[1]{%
330     \let\zf@ff      \@empty
331     \let\zf@scale  \@empty
332     \let\zf@adjust \@empty
333     \edef\@tempa{\noexpand\setkeys[zf]{options}{\zf@default@options#1}}%
334     \@tempa}

```

`\zf@init` This functionality has been removed from `\zf@get@feature@requests` because it's no longer the first thing that can affect these things.

```

335 \newcommand*\zf@init{%
336   \zf@icufalse
337   \let\zf@pre@ff      \@empty
338   \let\zf@font@feat  \@empty
339   \let\zf@font@str   \@empty
340   \let\zf@font@wrap  \@firstofone
341   \let\zf@suffix     \@empty
342   \let\zf@bf         \@empty
343   \let\zf@it         \@empty
344   \let\zf@bfit       \@empty
345   \let\zf@sc         \@empty
346   \let\zf@up@feat    \@empty
347   \let\zf@bf@feat    \@empty
348   \let\zf@it@feat    \@empty
349   \let\zf@bfit@feat  \@empty
350   \let\zf@sc@feat    \@empty
351   \let\zf@size\@empty
352   \let\zf@size@feat\@empty
353   \let\zf@size@fnt\@empty
354   \c@zf@script 1818326126\relax
355   \def\zf@script@name{Latin}%
356   \c@zf@language 0\relax
357   \def\zf@language@name{Default}%
358 }

```

`\zf@make@smallcaps` This macro checks if the font contains small caps, and if so creates the string for accessing them in `\zf@smallcaps`.

```

359 \newcommand*\zf@make@smallcaps{%
360   \let\zf@smallcaps\@empty
361   \ifzf@atsui
362     \zf@make@aat@feature@string{3}{3}%
363     \unless\ifx\@tempa\@empty
364       \edef\zf@smallcaps{\@tempa;}%
365     \fi
366   \fi
367   \ifzf@icu
368     \zf@check@ot@feat{+smcp}%
369     \if@tempswa
370       \edef\zf@smallcaps{+smcp,}%
371     \fi
372   \fi}

```

`\zf@update@ff` `\zf@ff` is the string used to define the list of specific font features. Each time another font feature is requested, this macro is used to add that feature to the list. AAT features are separated by semicolons, OpenType features by commas.

```

373 \newcommand*\zf@update@ff[1]{%
374   \unless\ifzf@firsttime
375     \xdef\zf@ff{\zf@ff #1\ifzf@icu,\else;\fi}%
376   \fi}

```

`\zf@make@feature` This macro is called by each feature key selected, and runs according to which type of font is selected.

```

377 \newcommand*\zf@make@feature[3]{%
For AAT fonts:
378   \ifzf@atsui
379     \def\@tempa{#1}%
380     \ifx\@tempa\@empty
381       \zf@PackageWarning{%
382         '\XKV@tfam=\XKV@tkey' feature not supported
383         for AAT font '\fontname\zf@basefont' }%
384     \else
385       \zf@make@aat@feature@string{#1}{#2}%
386       \ifx\@tempa\@empty
387         \zf@PackageWarning{%
388           AAT feature '\XKV@tfam=\XKV@tkey'
389           (#1,#2) not available in font \fontname\zf@basefont}%
390     \else
391       \zf@update@family{+#1,#2}%
392       \zf@update@ff\@tempa
393     \fi
394   \fi
395 \fi

```

For OpenType fonts:

```

396 \ifzf@icu
397   \edef\@tempa{#3}%
398   \ifx\@tempa\@empty
399     \zf@PackageWarning{%
400       '\XKV@tfam=\XKV@tkey' feature not supported
401       for ICU font '\fontname\zf@basefont' }%
402   \else
403     \expandafter\zf@check@ot@feat\expandafter{\@tempa}%
404     \if@tempswa
405       \zf@update@family{#3}%
406       \zf@update@ff{#3}%
407   \else
408     \zf@PackageWarning{%
409       OpenType feature '\XKV@tfam=\XKV@tkey' (#3)
410       not available in font \fontname\zf@basefont, script
411       '\zf@script@name', language '\zf@language@name'}%
412   \fi
413 \fi

```

414 \fi}

`\zf@define@font@feature` These macros are used in order to simplify font feature definition later on.

```
\zf@define@feature@option 415 \newcommand*\zf@define@font@feature[1]{%
416 \define@key[zf]{options}{#1}{\setkeys[zf@feat]{#1}{##1}}}
417 \newcommand*\zf@define@feature@option[5]{%
418 \define@key[zf@feat]{#1}{#2}[]{\zf@make@feature{#3}{#4}{#5}}}
```

`\keyval@alias@key` This macro maps one xkeyval key to another.

```
419 \newcommand*\keyval@alias@key[4][KV]{%
420 \let\cc{#1@#2@#4}{#1@#2@#3}%
421 \let\cc{#1@#2@#4@default}{#1@#2@#3@default}}
```

`\multi@alias@key` This macro iterates through families to map one key to another, regardless of which family it's contained within.

```
422 \newcommand*\multi@alias@key[2]{
423 \key@ifundefined[zf]{preparse}{#1}
424 {\key@ifundefined[zf]{options}{#1}
425 {\zf@PackageError{The feature #1 doesn't appear to be defined}
426 {It looks like you're trying to rename a feature that doesn't exist.}
427 {\keyval@alias@key[zf]{options}{#1}{#2}}}
428 {\keyval@alias@key[zf]{preparse}{#1}{#2}}}
```

`\zf@make@aat@feature@string` This macro takes the numerical codes for a font feature and creates a specified macro containing the string required in the font definition to turn that feature on or off. Used primarily in `\zf@make@aat@feature`, but also used to check if small caps exists in the requested font (see page 44).

```
429 \newcommand*\zf@make@aat@feature@string[2]{%
430 \edef\@tempa{\XeTeXfeaturename\zf@basefont #1}%
431 \unless\ifx\@tempa\@empty
```

For exclusive selectors, it's easy; just grab the string:

```
432 \ifnum\XeTeXisexclusivefeature\zf@basefont #1 > 0
433 \edef\@tempb{\XeTeXselectorname\zf@basefont #1 #2}%
```

For *non*-exclusive selectors, it's a little more complex. If the selector is even, it corresponds to switching the feature on:

```
434 \else
435 \unless\ifodd #2
436 \edef\@tempb{\XeTeXselectorname\zf@basefont #1 #2}%
```

If the selector is *odd*, it corresponds to switching the feature off. But \XeTeX doesn't return a selector string for this number, since the feature is defined for the 'switching on' value. So we need to check the selector of the previous number, and then prefix the feature string with ! to denote the switch.

```
437 \else
```

```

438     \edef\@tempb{\XeTeXselectorname\zf@basefont #1 \numexpr#2-1\relax}%
439     \unless\ifx\@tempb\@empty
440         \edef\@tempb{!\@tempb}%
441     \fi
442 \fi

```

Finally, save out the complete feature string in \@tempa. If the selector doesn't exist, re-initialise the feature string to empty.

```

443 \fi
444 \unless\ifx\@tempb\@empty

```

\zf@iv@strnum This macro takes a four character string and converts it to the numerical representation required for X₂TeX OpenType script/language/feature purposes. The output is stored in \@tempcnta.

The reason it's ugly is because the input can be of the form of any of these: 'abcd', 'abc', 'abc ', 'ab', 'ab ', etc. (It is assumed the first two chars are *always* not spaces.) So this macro reads in the string, delimited by a space; this input is padded with \@emptys and anything beyond four chars is snipped. The \@emptys then are used to reconstruct the spaces in the string to number calculation.

The variant \zf@v@strnum is used when looking at features, which are passed around with prepended plus and minus signs (e.g., +liga, -dlig); it simply strips off the first char of the input before calling the normal \zf@iv@strnum.

It's probable that all OpenType features *are* in fact four characters long, but not impossible that they aren't. So I'll leave the less efficient parsing stage in there even though it's not strictly necessary for now.

```

450 \newcommand\zf@iv@strnum[1]{%
451 \zf@iv@strnum@i#1 \@nil}
452 \def\zf@iv@strnum@i#1 \@nil{%

8.7 keyval definitions

This is the tedious section where we correlate all possible (eventually) font feature requests with their $\X_{\text{T}}\text{E}\text{X}$ representations.

8.7.1 Pre-parsed features

These features are extracted from the font feature list before all others, using `xkeyval's \setkeys*`.

ExternalLocation For fonts that aren't installed in the system. If no argument is given, the font is located with `kpsewhich`; it's either in the current directory or the $\text{T}_{\text{E}}\text{X}$ tree. Otherwise, the argument given defines the file path of the font.

```

502 \define@key[zf]{preprepare}{ExternalLocation}[]{}%
503 \zf@icutrue
504 \zf@noftrue\zf@noittrue
505 \gdef\zf@font@wrap##1{[#1##1]}

```

Renderer This feature must be processed before all others (the other font shape and features options are also pre-parsed for convenience) because the renderer determines the format of the features and even whether certain features are available.

```

506 \define@choicekey[zf]{preprepare}{Renderer}{AAT,ICU}{}%
507 \edef\zf@suffix{\zf@suffix/#1}%
508 \font\zf@basefont="\zf@font@wrap\zf@fontname\zf@suffix" at \f@size pt
509 \edef\zf@family@long{\zf@family@long +rend:#1}}

```

OpenType script/language See later for the resolutions from fontspec features to OpenType definitions.

```

510 \define@key[zf]{preprepare}{Script}{}%
511 \zf@icutrue
512 \edef\zf@suffix{\zf@suffix/ICU}%
513 \font\zf@basefont="\zf@font@wrap\zf@fontname\zf@suffix" at \f@size pt
514 \edef\zf@family@long{\zf@family@long +script:#1}%
515 {\setkeys[zf@feat]{Script}{#1}}

```

Exactly the same:

```

516 \define@key[zf]{preprepare}{Language}{}%
517 \zf@icutrue

```

```

518 \edef\zf@suffix{\zf@suffix/ICU}%
519 \font\zf@basefont="\zf@font@wrap\zf@fontname\zf@suffix" at \f@size pt
520 \edef\zf@family@long{\zf@family@long +language:#1}%
521 {\setkeys[zf@feat]{Lang}{#1}}

```

8.7.2 Bold/italic choosing options

The Bold, Italic, and BoldItalic features are for defining explicitly the bold and italic fonts used in a font family. v1.6 introduced arbitrary font features for these shapes (BoldFeatures, etc.), so the names of the shape-selecting options were appended with Font for consistency.

Fonts Bold:

```

522 \define@key[zf]{preparse}{BoldFont}{%
523 \edef\@tempa{#1}%
524 \ifx\@tempa\@empty
525 \zf@nobftrue
526 \edef\zf@family@long{\zf@family@long nobf}%
527 \else
528 \zf@nobffalse
529 \zf@partial@fontname#1\@nil=\zf@bf
530 \edef\zf@family@long{\zf@family@long bf:#1}%
531 \fi}

```

Same for italic:

```

532 \define@key[zf]{preparse}{ItalicFont}{%
533 \edef\@tempa{#1}%
534 \ifx\@tempa\@empty
535 \zf@noittrue
536 \edef\zf@family@long{\zf@family@long noit}%
537 \else
538 \zf@noitfalse
539 \zf@partial@fontname#1\@nil=\zf@it
540 \edef\zf@family@long{\zf@family@long it:#1}%
541 \fi}

```

Simpler for bold+italic:

```

542 \define@key[zf]{preparse}{BoldItalicFont}{%
543 \zf@partial@fontname#1\@nil=\zf@bfit
544 \edef\zf@family@long{\zf@family@long bfit:#1}}

```

Small caps isn't pre-parsed because it can vary with others above:

```

545 \define@key[zf]{options}{SmallCapsFont}{%
546 \edef\@tempa{#1}%
547 \ifx\@tempa\@empty
548 \zf@nosctrue
549 \edef\zf@family@long{\zf@family@long nosc}%
550 \else

```

```

551 \zf@noscfalse
552 \zf@partial@fontname#1\@nil=\zf@sc
553 \zf@update@family{sc:\zap@space #1 \@empty}%
554 \fi}

```

`\zf@partial@fontname` This macro takes the first token of its input and ends up defining #3 to the name of the font depending if it's been specified in full ("Baskerville Semibold") or in abbreviation ("* Semibold").

This could be done more flexibly by making * active; I'll change it later if I need to.

```

555 \def\zf@partial@fontname#1#2\@nil=#3{%
556 \if#1*\relax
557 \edef#3{\zf@fontname#2}%
558 \else
559 \edef#3{#1#2}%
560 \fi}

```

Features

```

561 \define@key[zf]{preparse}{UprightFeatures}{%
562 \def\zf@up@feat{,#1}%
563 \edef\zf@family@long{\zf@family@long rmfeat:#1}}
564 \define@key[zf]{preparse}{BoldFeatures}{%
565 \def\zf@bf@feat{,#1}%
566 \edef\zf@family@long{\zf@family@long bffeat:#1}}
567 \define@key[zf]{preparse}{ItalicFeatures}{%
568 \def\zf@it@feat{,#1}%
569 \edef\zf@family@long{\zf@family@long itfeat:#1}}
570 \define@key[zf]{preparse}{BoldItalicFeatures}{%
571 \def\zf@bfit@feat{,#1}%
572 \edef\zf@family@long{\zf@family@long bfitfeat:#1}}

```

Note that small caps features can vary by shape, so these in fact *aren't* pre-parsed.

```

573 \define@key[zf]{options}{SmallCapsFeatures}{%
574 \unless\ifzf@firsttime\def\zf@sc@feat{,#1}\fi
575 \zf@update@family{scfeat:\zap@space #1 \@empty}}

```

paragraphFeatures varying by size

```

576 \define@key[zf]{preparse}{SizeFeatures}{%
577 \unless\ifzf@firsttime
578 \def\zf@size@feat{#1}%
579 \fi
580 \zf@update@family{sizefeat:\zap@space #1 \@empty}}
581 \define@key[zf]{sizing}{Size}{\def\zf@size{#1}}
582 \define@key[zf]{sizing}{Font}{\def\zf@size@fnt{#1}}

```

8.7.3 Font-independent features

These features can be applied to any font.

Scale If the input isn't one of the pre-defined string options, then it's gotta be numerical. `\zf@calc@scale` does all the work in the auto-scaling cases.

```
583 \define@key[zf]{options}{Scale}{%
584   \edef\@tempa{#1}%
585   \edef\@tempb{MatchLowercase}%
586   \ifx\@tempa\@tempb
587     \zf@calc@scale{5}%
588   \else
589     \edef\@tempb{MatchUppercase}%
590     \ifx\@tempa\@tempb
591       \zf@calc@scale{8}%
592     \else
593       \edef\zf@scale{#1}%
594     \fi
595   \fi
596   \zf@update@family{+scale:\zf@scale}%
597   \edef\zf@scale{s*[\zf@scale]}
```

`\zf@calc@scale` This macro calculates the amount of scaling between the default roman font and the (default shape of) the font being selected such that the font dimension that is input is equal for both. The only font dimensions that justify this are 5 (lowercase height) and 8 (uppercase height in X_YTEX).

This script is executed for every extra shape, which seems wasteful, but allows alternate italic shapes from a separate font, say, to be loaded and to be auto-scaled correctly. Even if this would be ugly.

```
598 \newcommand\zf@calc@scale[1]{%
599   \begingroup
600     \rmfamily
601     \setlength\@tempdima{\fontdimen#1\font}%
602     \setlength\@tempdimb{\fontdimen#1\zf@basefont}%
603     \setlength\@tempdimc{1pt*\ratio{\@tempdima}{\@tempdimb}}%
604     \xdef\zf@scale{\strip@pt\@tempdimc}%
605     \zf@PackageInfo{\zf@fontname\space scale = \zf@scale}%
606   \endgroup}
```

Inter-word space These options set the relevant `\fontdimens` for the font being loaded.

```
607 \define@key[zf]{options}{WordSpace}{%
608   \zf@update@family{+wordspace:#1}%
609   \unless\ifzf@firsttime
610     \zf@wordspace@parse#1,\zf@@ii,\zf@@iii,\zf@@
611   \fi}
```

`\zf@wordspace@parse` This macro determines if the input to `WordSpace` is of the form `{X}` or `{X,Y,Z}` and executes the font scaling. If the former input, it executes `{X,X,X}`.

```

612 \def\zf@wordspace@parse#1,#2,#3,#4\zf@@{%

Turkish Turns out that many fonts use ‘TUR’ as their Turkish language tag rather than the specified ‘TRK’. So we check for both:

```

1001 \define@key[zf@feat]{Lang}{Turkish}[]{}%
1002 \zf@check@ot@lang{TRK}%
1003 \if@tempswa
1004 \c@zf@language\@tempcnta\relax
1005 \xdef\zf@language@name{Turkish}%
1006 \xdef\zf@family@long{\zf@family@long+lang=Turkish}%
1007 \xdef\zf@pre@ff{\zf@pre@ff language=TRK,}%
1008 \else
1009 \zf@check@ot@lang{TUR}%
1010 \if@tempswa
1011 \c@zf@language\@tempcnta\relax
1012 \xdef\zf@language@name{Turkish}%
1013 \xdef\zf@family@long{\zf@family@long+lang=Turkish}%
1014 \xdef\zf@pre@ff{\zf@pre@ff language=TUR,}%
1015 \else
1016 \zf@PackageWarning{Font \fontname\zf@basefont does not contain
1017 language '#1' for script '\zf@script@name'}%
1018 \fi
1019 \fi}

```

8.7.21 Raw feature string

This allows savvy X_YT_EX-ers to input font features manually if they have already memorised the OpenType abbreviations and don’t mind not having error checking.

```

1020 \define@key[zf]{options}{RawFeature}{%
1021 \zf@update@family{+Raw:#1}%
1022 \zf@update@ff{#1}}

```

8.8 Italic small caps

The following code for utilising italic small caps sensibly is inspired from Philip Lehman's *The Font Installation Guide*. Note that `\upshape` needs to be used *twice* to get from italic small caps to regular upright (it always goes to small caps, then regular upright).

`\sishape` First, the commands for actually selecting italic small caps are defined. I use `si`
`\textsi` as the NFSS shape for italic small caps, but I have seen `itsc` and `slsc` also used.
`\sidesdefault` may be redefined to one of these if required for compatibility.

```
1023 \providecommand*\sidesdefault}{si}
1024 \DeclareRobustCommand{\sishape}{%
1025   \not@math@alphabet\sishape\relax
1026   \fontshape\sidesdefault\selectfont}
1027 \DeclareTextFontCommand{\textsi}{\sishape}
```

`\zf@merge@shape` This is the macro which enables the overload on the `\. . shape` commands. It takes three such arguments. In essence, the macro selects the first argument, unless the second argument is already selected, in which case it selects the third.

```
1028 \newcommand*\zf@merge@shape}[3]{%
1029   \edef\@tempa{#1}%
1030   \edef\@tempb{#2}%
1031   \ifx\@shape\@tempb
1032     \ifcsname\@encoding/\@family/\@series/#3\endcsname
1033       \edef\@tempa{#3}%
1034     \fi
1035   \fi
1036   \fontshape{\@tempa}\selectfont}
```

`\itshape` Here the original `\. . shape` commands are redefined to use the merge shape
`\scshape` macro.

```
\upshape 1037 \DeclareRobustCommand{\itshape}{%
1038   \not@math@alphabet\itshape\mathit
1039   \zf@merge@shape\itdefault\scdefault\sidesdefault}
1040 \DeclareRobustCommand{\slshape}{%
1041   \not@math@alphabet\slshape\relax
1042   \zf@merge@shape\sldefault\scdefault\sidesdefault}
1043 \DeclareRobustCommand{\scshape}{%
1044   \not@math@alphabet\scshape\relax
1045   \zf@merge@shape\scdefault\itdefault\sidesdefault}
1046 \DeclareRobustCommand{\upshape}{%
1047   \not@math@alphabet\upshape\relax
1048   \zf@merge@shape\updefault\sidesdefault\scdefault}
```

`\em` Redefinitions moved to the `xltxtra` package.
`\emph`

8.9 Selecting maths fonts

Here, the fonts used in math mode are redefined to correspond to the default roman, sans serif and typewriter fonts. Unfortunately, you can only define maths fonts in the preamble, otherwise I'd run this code whenever `\setromanfont` and `friends` was run.

`\AtBeginDocument` Everything here is performed `\AtBeginDocument` in order to overwrite euler's attempt. This means `fontspec` must be loaded *before* euler. We set up a conditional to return an error if this rule is violated.

Since every maths setup is slightly different, we also take different paths for defining various math glyphs depending which maths font package has been loaded. As far as I am aware, the only two options for X_YTeX are euler and `lucbmath`. Unless I've got all confused and the `mathtime` fonts are not virtual fonts either. But I'm pretty sure they are.

```

1049 \ifpackageloaded{euler}{\zf@package@euler@loadedtrue}
1050                               {\zf@package@euler@loadedfalse}
1051 \AtBeginDocument{%
1052   \let\zf@font@warning\@font@warning
1053   \let\@font@warning\@font@info
1054   \ifpackageloaded{euler}{%
1055     \ifzf@package@euler@loaded
1056       \zf@math@eulertrue
1057     \else
1058       \zf@PackageError{The euler package must be loaded BEFORE fontspec}
1059         {fontspec only overwrites euler's attempt to \MessageBreak
1060         define the maths text fonts if fontspec is \MessageBreak
1061         loaded after euler. Type <return> to proceed\MessageBreak
1062         with incorrect \protect\mathit, \protect\mathbf, etc}
1063     \fi}{}
1064   \ifpackageloaded{lucbmath}{\zf@math@lucidatrue}{}
1065   \ifpackageloaded{lucidabr}{\zf@math@lucidatrue}{}
1066   \ifpackageloaded{lucimatx}{\zf@math@lucidatrue}{}

```

Knuth's CM fonts are all squashed together, combining letters, accents, text symbols and maths symbols all in the one font, `cmr`, plus other things in other fonts. Because we are changing the roman font in the document, we need to redefine all of the maths glyphs in L^AT_EX's operators maths font to still go back to the legacy `cmr` font for all these random glyphs, unless a separate maths font package has been loaded instead.

In every case, the maths accents are always taken from the operators font, which is generally the main text font. (Actually, there is a `\hat` accent in Euler-Fraktur, but it's *ugly*. So I ignore it. Sorry if this causes inconvenience.)

```

1067 \DeclareSymbolFont{legacymaths}{OT1}{cmr}{m}{n}
1068 \SetSymbolFont{legacymaths}{bold}{OT1}{cmr}{bx}{n}
1069 \DeclareMathAccent{\acute}{\mathalpha}{legacymaths}{19}

```

```

1070 \DeclareMathAccent{\grave}    {\mathalpha}{legacymaths}{18}
1071 \DeclareMathAccent{\ddot}    {\mathalpha}{legacymaths}{127}
1072 \DeclareMathAccent{\tilde}   {\mathalpha}{legacymaths}{126}
1073 \DeclareMathAccent{\bar}     {\mathalpha}{legacymaths}{22}
1074 \DeclareMathAccent{\breve}   {\mathalpha}{legacymaths}{21}
1075 \DeclareMathAccent{\check}   {\mathalpha}{legacymaths}{20}
1076 \DeclareMathAccent{\hat}     {\mathalpha}{legacymaths}{94} % too bad, euler
1077 \DeclareMathAccent{\dot}     {\mathalpha}{legacymaths}{95}
1078 \DeclareMathAccent{\mathring}{\mathalpha}{legacymaths}{23}

```

`\colon`: **what's going on?** Okay, so `:` and `\colon` in maths mode are defined in a few places, so I need to work out what does what. Respectively, we have:

```

% fontmath.ltx:
\DeclareMathSymbol{\colon}{\mathpunct}{operators}"3A}
\DeclareMathSymbol{:}{\mathrel}{operators}"3A}

% amsmath.sty:
\renewcommand{\colon}{\nobreak\mskip2mu\mathpunct}{\nonscript
\mkern-\thinmuskip{:}\mskip6mu\plus1mu\relax}

% euler.sty:
\DeclareMathSymbol{:}{\mathrel}{EulerFraktur}"3A}

% lucbmath.sty:
\DeclareMathSymbol{@tempb}{\mathpunct}{operators}{58}
\ifx\colon@tempb
  \DeclareMathSymbol{\colon}{\mathpunct}{operators}{58}
\fi
\DeclareMathSymbol{:}{\mathrel}{operators}{58}

```

($3A_{16} = 58_{10}$) So I think, based on this summary, that it is fair to tell `fontspec` to 'replace' the `operators` font with `legacymaths` for this symbol, except when `amsmath` is loaded since we want to keep its definition.

```

1079 \begingroup
1080   \mathchardef@tempa="603A %
1081   \let\next\egroup
1082   \ifx\colon@tempa
1083     \DeclareMathSymbol{\colon}{\mathpunct}{legacymaths}{58}
1084   \fi
1085 \endgroup

```

The following symbols are only defined specifically in `euler`, so skip them if that package is loaded.

```

1086 \ifzf@math@euler\else
1087   \DeclareMathSymbol{!}{\mathclose}{legacymaths}{33}

```

```

1088 \DeclareMathSymbol{:}{\mathrel}{legacymaths}{58}
1089 \DeclareMathSymbol{;}{\mathpunct}{legacymaths}{59}
1090 \DeclareMathSymbol{?}{\mathclose}{legacymaths}{63}

```

And these ones are defined both in euler and lucbmath, so we only need to run this code if no extra maths package has been loaded.

```

1091 \ifzf@math@lucida\else
1092 \DeclareMathSymbol{0}{\mathalpha}{legacymaths}{0}
1093 \DeclareMathSymbol{1}{\mathalpha}{legacymaths}{1}
1094 \DeclareMathSymbol{2}{\mathalpha}{legacymaths}{2}
1095 \DeclareMathSymbol{3}{\mathalpha}{legacymaths}{3}
1096 \DeclareMathSymbol{4}{\mathalpha}{legacymaths}{4}
1097 \DeclareMathSymbol{5}{\mathalpha}{legacymaths}{5}
1098 \DeclareMathSymbol{6}{\mathalpha}{legacymaths}{6}
1099 \DeclareMathSymbol{7}{\mathalpha}{legacymaths}{7}
1100 \DeclareMathSymbol{8}{\mathalpha}{legacymaths}{8}
1101 \DeclareMathSymbol{9}{\mathalpha}{legacymaths}{9}
1102 \DeclareMathSymbol{\Gamma}{\mathalpha}{legacymaths}{0}
1103 \DeclareMathSymbol{\Delta}{\mathalpha}{legacymaths}{1}
1104 \DeclareMathSymbol{\Theta}{\mathalpha}{legacymaths}{2}
1105 \DeclareMathSymbol{\Lambda}{\mathalpha}{legacymaths}{3}
1106 \DeclareMathSymbol{\Xi}{\mathalpha}{legacymaths}{4}
1107 \DeclareMathSymbol{\Pi}{\mathalpha}{legacymaths}{5}
1108 \DeclareMathSymbol{\Sigma}{\mathalpha}{legacymaths}{6}
1109 \DeclareMathSymbol{\Upsilon}{\mathalpha}{legacymaths}{7}
1110 \DeclareMathSymbol{\Phi}{\mathalpha}{legacymaths}{8}
1111 \DeclareMathSymbol{\Psi}{\mathalpha}{legacymaths}{9}
1112 \DeclareMathSymbol{\Omega}{\mathalpha}{legacymaths}{10}
1113 \DeclareMathSymbol{+}{\mathbin}{legacymaths}{43}
1114 \DeclareMathSymbol{=}{\mathrel}{legacymaths}{61}
1115 \DeclareMathDelimiter{(}{\mathopen}{legacymaths}{40}{largesymbols}{0}
1116 \DeclareMathDelimiter{)}{\mathclose}{legacymaths}{41}{largesymbols}{1}
1117 \DeclareMathDelimiter{[}{\mathopen}{legacymaths}{91}{largesymbols}{2}
1118 \DeclareMathDelimiter{]}\mathclose}{legacymaths}{93}{largesymbols}{3}
1119 \DeclareMathDelimiter{/}{\mathord}{legacymaths}{47}{largesymbols}{14}
1120 \DeclareMathSymbol{\mathdollar}{\mathord}{legacymaths}{36}
1121 \fi
1122 \fi

```

Finally, we change the font definitions for `\mathrm` and so on. These are defined using the `\zf@rmmaths` (...) macros, which default to `\rmdefault` but may be specified with the `\setmathrm` (...) commands in the preamble.

Since L^AT_EX only generally defines one level of boldness, we omit `\mathbf` in the bold maths series. It can be specified as per usual with `\setboldmathrm`, which stores the appropriate family name in `\zf@rmboldmaths`.

```

1123 \DeclareSymbolFont{operators}\zf@enc\zf@rmmaths\mddefault\updefault
1124 \SetSymbolFont{operators}{normal}\zf@enc\zf@rmmaths\mddefault\updefault
1125 \SetMathAlphabet\mathrm{normal}\zf@enc\zf@rmmaths\mddefault\updefault

```

```

1126 \SetMathAlphabet\mathit{normal}\zf@enc\zf@rmmaths\mddefault\itdefault
1127 \SetMathAlphabet\mathbf{normal}\zf@enc\zf@rmmaths\bfdefault\updefault
1128 \SetMathAlphabet\mathsf{normal}\zf@enc\zf@sfmaths\mddefault\updefault
1129 \SetMathAlphabet\mathtt{normal}\zf@enc\zf@ttmaths\mddefault\updefault
1130 \SetSymbolFont{operators}{bold}\zf@enc\zf@rmmaths\bfdefault\updefault
1131 \ifdefined\zf@rmboldmaths
1132 \SetMathAlphabet\mathrm{bold}\zf@enc\zf@rmboldmaths\mddefault\updefault
1133 \SetMathAlphabet\mathbf{bold}\zf@enc\zf@rmboldmaths\bfdefault\updefault
1134 \SetMathAlphabet\mathit{bold}\zf@enc\zf@rmboldmaths\mddefault\itdefault
1135 \else
1136 \SetMathAlphabet\mathrm{bold}\zf@enc\zf@rmmaths\bfdefault\updefault
1137 \SetMathAlphabet\mathit{bold}\zf@enc\zf@rmmaths\bfdefault\itdefault
1138 \fi
1139 \SetMathAlphabet\mathsf{bold}\zf@enc\zf@sfmaths\bfdefault\updefault
1140 \SetMathAlphabet\mathtt{bold}\zf@enc\zf@ttmaths\bfdefault\updefault
1141 \let\font@warning\zf@font@warning}

```

8.10 Finishing up

Now we just want to set up loading the .cfg file, if it exists.

```

1142 \if@zf@configfile
1143 \InputIfFileExists{fontspec.cfg}
1144 {\typeout{fontspec.cfg loaded.}}
1145 {\typeout{No fontspec.cfg file found; no configuration loaded.}}
1146 \fi

```

The end! Thanks for coming.

File II

fontspec.cfg

As an example, and to avoid upsetting people as much as possible, I'm populating the default fontspec.cfg file with backwards compatibility feature aliases.

```
1

9 \setsansfont{Lucida Sans}
10 \setmonofont{Lucida Sans Typewriter}
11
12 \frenchspacing % TeX's default is a little old-fashioned...
13
14 \begin{document}
15 \pagestyle{empty}
16
17 \section*{The basics of the \textsf{fontspec} package}
18
19 The \textsf{fontspec} package enables automatic font selection for \La-
TeX documents typeset with \XeTeX. The basic command is\
20 \indent \verb|\fontspec[font features]{font display name}|.\
21 As an example:
22
23 \begin{center}
24   \Large
25   \fontspec[
26     Colour           = 0000CC,
27     Numbers          = OldStyle,
28     VerticalPosition = Ordinal,
29     Variant          = 2
30   ]{Apple Chancery}
31   My 1st example of Apple Chancery
32 \end{center}
33
34 The default roman, sans serif, and typewriter fonts may be set with the \verb|\setromanfont|, \verb|\setseriffont|, and \verb|\setmonofont| commands, respectively, as shown in the preamble. They take the same syntax as the \verb|\fontspec| package. All expected font shapes are available:
35
36 \begin{center}
37   {\itshape Italics and \scshape small caps\dots}\
38   {\sffamily\bfseries Bold sans serif and \itshape bold italic sans serif\dots}
39 \end{center}
40
41 With the roman and sans serif fonts set in the preamble, text fonts in math mode are also changed: the face 'Euler' has been used in this document (with the \textsf{euler} package---or the \textsf{eulervm} package if the lxpdfvimxl driver is being used), since the default Computer Modern maths font is rather light.
42 \[
43 \mathcal{F}(s) = \int^{\infty}_0 f(t) \exp(-st)\, \mathrm{d}t
44 \]
45
46 You'll also notice the \verb|\defaultfontfeatures| command in the preamble. This command takes a single argument of font features that are then applied to every subsequent instance of font selection. The first argument in this case, \verb|\Mapping=tex-text|, enables regular \TeX ligatures.

```

tures like `\verb|`---'|` for ``---'`. The second automatically scales the fonts to the same x-height.

47
48 Please see the documentation for font feature explanation and further pack-
age niceties.

49
50 `\end{document}`

Change History

v1.0		
	General: Initial version.	31
v1.1		
	General: Name change to fontspec.	31
	\setmainfont: Implemented (with friends).	34
v1.10		
	General: Color brought back into the .sty	54
	New feature LetterSpace.	53
	Some babel encoding problems resolved.	33
	\addfontfeatures: Saved family information macro changes.	36
	\AtBeginDocument: Added lucimatx checking. (Not really tested, though.)	65
	Fixed Lucida bug (missing \else)	65
	\zf@fontspec: Saved family info split into two (now three) macros.	41
	Space zapped from L ^A T _E X family name due to various problems.	41
	\zf@make@feature: Removed embarrassing space after warnings.	46
v1.11		
	General: HyphenChar checks its input now.	53
	Added better support for Turkish language selection.	64
	Ensure bold/italic fonts are loaded with the same renderer as the regular font even if unspecified.	41
	OpenType Variant fixed.	57
	\emph: Redefinitions moved to xltextra.	65
	\newfontface: Name change from \newfontfamily.	35
	\newfontlanguage: Fixed \c@zf@language setting not being global.	37
	\newfontscript: Fixed \c@zf@script setting not being global.	37
	\zf@wordspace@parse: Improved saving \fontdimen stuff to \zd@adjust (also see PunctuationSpace).	53
v1.12		
	General: BoldFont, etc., flags \zf@nobf conditional false rather than assuming it implicitly. This allows, e.g., empty BoldFont to be overloaded.	50
	Finally, use the EU1 font encoding.	33
	New feature ExternalLocation for loading external fonts.	49
	Package option for disabling the EU1 encoding.	32
	\addfontfeatures: Now use grouping to restore \zf@default@option change.	36
	\zf@make@aat@feature@string: Fixed result of \XeTeXfeaturename output change (empty string if odd non-exclusive selector).	47
	Removed \@thisfontfeature macro; replaced with \@tempa.	47
v1.13		
	General: RawFeature added	64
	SizeFeatures: Beginnings of support for different font features for different font sizes, required by unimath.	52
	\zf@DeclareFontShape: New feature SizeFeatures implemented.	43
	\zf@make@feature: Warns (and fixes bug) when an AAT feature is requested for an ICU font and vice versa.	46

\zf@partial@fontname: Folded in the \@tempa\let command, changing the syntax.	51
v1.2	
General: Initial OpenType support.	31
Support for Scale.	52
v1.3	
General: More OpenType support.	31
Support for Mapping and Colour.	54
\defaultfontfeatures: Implemented.	35
\newAATfeature: Implemented.	36
\newfontfeature: Implemented.	36
v1.3a	
General: Bug fix for OpenType small caps.	56
v1.4	
General: Support for Weight and Width AAT features.	54
\AtBeginDocument: Selects the default \mathXX fonts.	65
\defaultfontfeatures: Name changed from \setdefaultoptions.	35
v1.5	
General: New options for arbitrary bold/italic shapes.	50
\addfontfeatures: Implemented.	36
\zf@fontspec: Added code for choosing arbitrary bold/italic fonts.	41
Checks if the font family has already been defined.	41
NFSS specifiers now take the default values.	41
\zf@make@font@shapes: Absorbed font-checking from \zf@fontspec.	42
v1.5a	
\AtBeginDocument: Added fix for Computer Modern maths.	65
v1.6	
General: Bold option aliased to BoldFont.	50
LetterCase is now Letters and options changed appropriately.	56
Scale feature now updates family name.	52
All AAT Fractions features offered.	57
New OpenType feature: Language	60
New OpenType feature: Script	59
OpenType letters features: PetiteCaps and PETITECAPS.	56
OpenType ligature features: Contextual and Historical.	55
OpenType stylistic sets supports under the Variant option.	57
\addfontfeatures: Removed \relaxing of temporary macros.	36
\AtBeginDocument: Removed mathtime support since XeTeX doesn't handle virtual fonts. Why did I put it in in the first place?	65
\fontspec: Removed \zf@currfont (unnecessary)	33
\newfontface: Implemented.	35
\newfontfeature: newff counter now uses LaTeX methods rather than primitive TeX. I don't know if there is any advantage to this.	36
\setmainfont: Changed \rmdefault, etc., assigning to use \let directly.	34
\zf@fontspec: Added code for choosing arbitrary bold/italic font features.	41
Writes some info to the .log file	41

\zf@get@feature@requests: Removed the space between the comma and \zf@options when it's concatenated with the defaults.	44
v1.7	
General: Style feature renamed from StyleOptions.	58
AAT Numbers:SlashedZero.	56
New feature: Annotation	58
New feature: CharacterShape	58
New feature: CharacterWidth	58
New feature: OpticalSize; works with both OpenType and MM fonts.	54
OpenType Alternate Fractions feature.	57
OpenType Alternate now only AAT.	57
Removed AAT check for weight/width axes (could also be Multiple Master)	54
\zf@define@feature@option: Implemented for the bulk of the feature processing code.	46
\zf@fontspec: Optional argument now mandatory.	41
\zf@make@aat@feature@string: Changed some \edefs to \let	47
Removed third argument; always saves the feature string in \zf@thisfontfeature	47
\zf@make@feature: Accommodation of the \zf@thisfontfeature change.	46
\zf@make@font@shapes: Changed some \edefs to \let.	42
Support for the OpticalSize feature.	42
\zf@make@smallcaps: Accommodation of the \zf@thisfontfeature change.	45
\zf@set@font@type: Added 'MM' font type; tests true, e.g., with Skia & Minion MM. Used with the OpticalSize feature.	41
Removed exclusivity from font type (AAT, OpenType) check, since fonts can be both.	41
Removed various \count255s.	41
\zf@update@ff: Fix for featureless fonts (e.g., the MS fonts) being ignored.	45
v1.8	
\AtBeginDocument: Added support for user-specified \mathrm and others.	65
Finally fixed legacy maths font issues. Also checks that euler.sty is loaded in the right order.	65
\setmathrm: Implemented (with friends).	34
v1.8a	
\AtBeginDocument: Added conditional to \colon math symbol (incompatibility with lucida and amsmath)	65
v1.9	
General: CharacterShape now CJKShape	58
SMALLCAPS option changed to UppercaseSmallCaps to facilitate option normalisation (to come). Similarly for PETITECAPS.	56
Swashes feature changed to Contextuals. Option of this feature Contextual changed to Swash, for obvious reasons.	56
TextSpacing now CharacterWidth, with associated option names' change.	58
Alternate/Variant options can be assigned names.	57
New Scale options: MatchLowercase and MatchUppercase.	52
New feature HyphenChar.	53
New feature Kerning.	57
New feature PunctuationSpace.	53

New feature UprightFeatures.	50
New feature Vertical.	59
New feature WordSpace.	53
New features SmallCapsFont and SmallCapsFeatures.	50
Package options (no)config, quiet implemented.	68
\addfontfeatures: Added \ignorespaces to make it invisible.	36
Changed \fontspec call to \@fontspec so that \ignorespaces isn't called unnecessarily.	36
\aliasfontfeature: Implemented.	37
\aliasfontfeatureoption: Implemented.	37
\AtBeginDocument: Maths hex numbers converted to decimal.	65
Suppresses harmless maths font encoding warnings.	68
\emph: Redefined \em in order for nested emphases to work.	65
\fontspec: Added \ignorespaces to make it invisible.	33
\keyval@alias@key: Implemented.	46
\multi@alias@key: Implemented for \aliasfontfeature.	46
\newAATfeature: Replacement for \newfeaturecode.	36
\newfontlanguage: Implemented.	37
\newfontscript: Implemented.	37
\newICUfeature: Implemented.	36
\zf@calc@scale: Implemented for auto-scaling options.	53
\zf@check@ot@feat: Implemented.	49
\zf@check@ot@lang: Implemented.	48
\zf@check@ot@script: Implemented.	48
\zf@DeclareFontShape: Implemented as wrapper for \DeclareFontShape.	43
Slanted/italic shape substitution implemented.	43
\zf@fontspec: Absorbed the comma into \zf@..@options as to be more efficient when they are not defined.	41
Abstracted the long family name so the NFSS family is simple.	41
Incorporated \zf@get@feature@requests argument change.	41
Incorporated \zf@make@font@shapes change; removed \zf@options storage macro.	41
\zf@get@feature@requests: Absorbed comma into \zf@default@options, making \zf@current@options redundant.	44
Added an argument to eliminate the \zf@options macro.	44
Removed init stuff.	44
\zf@init: Taken from \zf@get@feature@requests.	44
\zf@make@feature: Now checks for OpenType feature.	46
\zf@make@font@shapes: \zf@scale@str eliminated.	42
Absorbed \IfEqFonts.	42
Added argument for \zf@get@feature@requests change.	42
Added code for SmallCaps... features.	42
Added logging of /B, /I, /BI failure.	42
Changed input syntax.	42
Incorporated \sidedefault test into the \DeclareFontShape argument directly now that it's fully expanded.	42
Made local to hide \zf@fontname changes.	42

Removed \zf@scshape macro.	42
Removed \nfss@catcodes wrapper.	42
\zf@make@smallcaps: Now uses \zf@check@ot@feat.	45
\zf@partial@fontname: Implemented.	51
\zf@update@family: Now fully expands arguments.	43
\zf@update@ff: Removed ridiculous \zf@feature@separator code.	45
\zf@v@strnum: Implemented.	48
\zf@wordspace@parse: Implemented.	53

Index

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in **roman** refer to the code lines where the entry is used.
